

# **ENGINEERING MANUAL**

**Issue 3.3 - April 2011 - English version**

## **APPLICATION CONSIDERATIONS.**

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Emerson Power Transmission Solutions and its divisions with respect to the use of products and components is given in good faith and without charge, and Emerson assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, Disclaimers of Warranty, Limitation of Liability and Remedy, please contact Customer Service or see our website.

These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use an Emerson Power Transmission Solutions product referred to herein, including any person who buys from a licensed distributor of these branded products.

**CAUTION:** The applicable Emerson Power Transmission Solutions product catalogs and installation/maintenance bulletins must be used along with the selection programs available on this site. These documents contain important precautions and other information intended to reduce the risk of bodily injury. Refer to these documents before specifying, installing, operating or servicing equipment.

**CAUTION:** Be sure only qualified individuals familiar with Emerson Power Transmission Solutions products use the selection programs available on this site. Incorrect and/or incomplete input data could cause the selection of improper components, potentially resulting in bodily injury. Product selection programs available on this site are intended to assist users in the proper selection and application of power transmission products and components. Emerson Power Transmission Solutions makes no warranties, express or implied, of merchantability or fitness for a particular purpose.

Emerson Power Transmission Solutions will not be liable for direct or indirect incidental, consequential or punitive damages arising from the use or inability to use this any of the information made available on this site, including but not limited to product literature, selection programs, and interchange guides.

Emerson Power Transmission Solutions reserves the right to correct, modify, update and/or enhance software programs at any time without notice or penalty, including but not limited to pricing, technical data, etc.

For more technical information, contact our Technical Support.

| • Bearings and shafts .....             | 76 |  |     |

# Quality and Service

### When you are looking for a quality conveyor component, look at System Plast.

#### **Your expectation, our standard.**

*Customers expect the best from System Plast; we are committed to delivering nothing less. In every phase of our operation, from engineering, to production, to sales and assistance, System Plast is committed to complying with the stringent standards of ISO 9001.*

We put our Leadership on the line for you.

Our complete range of products combines stainless steel, carbon steel, aluminium and engineered plastics to achieve reliability, superior performance and a compact of design.

As one of the world's leading suppliers of conveyor components, System Plast has a tradition of innovation that dates back to 1985 when we entered into this field. System Plast Components have become the standard of design and performance to a wide range of industries, including conveyor manufacturing, materials handling, power transmission, packaging and many more.

In addition to manufacturing excellence, System Plast has earned a reputation for outstanding customer service, offering a full range of design, custom fabrication and support services.

We hope you will now take a moment to look through this comprehensive manual.

Then, when you are ready to discuss your needs with the nearest System Plast representative, please consult the back cover of this catalog for further details about our sales network.

We are able and eager to assist you setting up a smooth running line.

### The components you want, when and how you want them.

System Plast is ready and able to satisfy your needs with quick answers and delivery of standard or custom made products. Our customers around the world know that the shortest distance between a problem and its solution is to call us: innovations, research, engineering and production are always under a strict control to improve our service and products.

## Application driven

Focus on application and improvements have been the driving force behind Research and Development at System Plast, the largest global supplier of Conveyor Components.

The most important issues in the beverage and packaging industry are EFFICIENCY, NOISE REDUCTION, HYGIENE, TCO and LUBRICATION REDUCTION. The engineering team of System Plast has taken the issues as a challenge and developed a range of products around them, thus gaining the leading edge on the market by supporting the users in their corporate programs such as TPM, Total Productive Maintenance.

System Plast is a solid partner for the beverage, food and packaging industry. Not only these state-of-the-art developments are important, but just as well that it has the largest available program of conveyor components, chains and belts.

The network of System Plast companies in Italy, Germany, France, UK, Netherlands, USA, Mexico and Brazil, together with the worldwide network of exclusive distributors, services the clients - OEM's as well as end users, including the leading companies in the industry. The people in the field are trained with know-why and know-how and are strongly supported by the engineering team.

## Largest range

System Plast delivers the largest range of chains, modular belts, components, bearings, feet.

Conveyor Line: massive, versatile range of conveyor parts like supports, clamps, brackets, guides in plastic and stainless steel; easy combinations for many applications.

Bearing Line: flange bearings in many types and shapes. Completely closed types available for wet environments. Long life versions for ease of maintenance.

Presso Line: the largest range of support feet available. The right choice for any application; from food processing to electrical cabinets.

Modular Plastic Belts: robust design for easy installation and maintenance. Not only the standard range, but special types for difficult products as well. Special materials for dry running, long life and low noise.

SlatBand Chains: chain is the main factor for efficiency of conveyors. System Plast has a wide range of high quality chains in plastic and stainless steel. Special materials for exceptional applications.

# Engineering manual for conveyor components

This Engineering Manual has been developed to assist you with specific engineering information when a new conveyor is designed as well as when an existing conveyor is going to be modified. Terms like TPM (Total Productive Maintenance) and SMED (Single Minute Exchange of Dies) are getting more and more important. With the right choice of chains and components you can design your conveyors to meet these principles. A large part of our program suits these principles.

With this manual we intend to create some "CONVEYOR AWARENESS". As you will notice, most attention will be given to the construction details for chains and belts, because these are the 'moving parts' in a conveyor and therefore more critical when it comes to construction details. We also emphasize on guides as together with the chains and belts, these are in direct contact with the customer's product and therefore of utmost importance. The right choice of type, style and material of the side guides can make the difference between a medium and a high production efficiency of a filling line.

For additional data and information about technical details of our products please refer to:

- **Conveyor Chains & Belts catalogue**

## General selection guidelines

| Product  | Preferred options  | Other options                   | Lubrication  |
|--|--|---------------------------------|--|
| <br><b>Cans</b><br>(2-piece, aluminium) | Flush grid belt<br>e.g. 2250 FG, PowerFlex   | Plastic chain<br>e.g. 828, 880M | - Lubrication is recommended.<br>- So called "half-wet" conditions should be avoided in order to improve service life of chains/belts and components. In such cases aluminium-oxide acts abrasively. |
| <br><b>One-way glass</b>                 | SS chain<br>e.g. Speed-Line, Speed-Line HB<br><br>Flat top belt<br>e.g. 2250 FT, PowerFlex                               | Plastic chain<br>e.g. 828, 880M | - Lubrication is required for all sections with SS chains.   |
| <br><b>Return glass</b>                  | SS chain<br>e.g. Speed-Line, Speed-Line HB   |                                 | - Lubrication is required.   |
| <br><b>One-way PET</b>                  | Flat top belt<br>e.g. 2250 FT, 2120 FT<br>PowerFlex, FlowFlex  | Plastic chain<br>e.g. 828, 880M | - Lubrication is recommended.<br>So-called "dry lubrication" is commonly used.   |
| <br><b>Return PET</b>                  | SS chain<br>e.g. Speed-Line, Speed-Line HB<br><br>Flat Top belt<br>e.g. 2250 FT, PowerFlex                               | Plastic chain<br>e.g. 828, 880M | - Lubrication is required for all sections with SS chains.   |
| <br><b>Crates</b>                      | SS chain<br>e.g. SSE 815 K750<br>SSE 8157 K750 VG, HB<br><br>CC chain<br>e.g. CC 600                                     |                                 | - Lubrication is required for all sections with SS chains.   |
| <br><b>Boxes</b>                       | Flat Top belt<br>e.g. 2250 FT, 2251 FT,<br>2120 FT, LBP, VG,<br>PowerFlex, FlowFlex                                      | Plastic chain<br>e.g. 828, 880M | - In most cases lubrication is not admitted.   |
| <br><b>Shrink-wrapped products</b>     | Flat Top belt<br>e.g. 2251 FT, VG, LBP<br>2120 FT, VG, LBP<br>PowerFlex<br><br>Plastic chain<br>e.g. 8257, 882M, LBP, VG |                                 | - In most cases lubrication is not admitted.   |

| Materials  | Remarks  |
|--|--|
| <ul style="list-style-type: none"> <li>- NG material is recommended for sections with abrasive conditions.</li> <li>- CR material is recommended for sections where higher friction is required (e.g. twister).</li> <li>- LF material is generally suitable for well lubricated sections.</li> </ul>  | <ul style="list-style-type: none"> <li>- TransferWing version is commonly used for 90 degree transfers between conveyors.</li> </ul>   |
| <ul style="list-style-type: none"> <li>- Extra Plus material is recommended.</li> <li>- Standard material can be used on slow speed and low load sections.</li> <li>- HB pins are recommended in order to extend service life of chains.</li> <li>- NG material is suitable for dry-running sections (e.g. depalletizer).</li> </ul>                               | <ul style="list-style-type: none"> <li>- K330 width offers reduced gap between adjacent chains and improves product stability particularly in side-transferring sections.</li> </ul>   |
| <ul style="list-style-type: none"> <li>- Extra Plus material is recommended.</li> <li>- Standard material can be used on slow speed and low load sections.</li> <li>- HB pins are recommended in order to extend service life of chains.</li> </ul>  | <ul style="list-style-type: none"> <li>- K330 width offers reduced gap between adjacent chains and improves product stability particularly in side-transferring sections.</li> </ul>   |
| <ul style="list-style-type: none"> <li>- LF material is suitable with lubrication.</li> <li>- NG material is recommended for dry run as well as for sections where chemical attack must be expected (e.g. peracetic acid).</li> </ul>  | <ul style="list-style-type: none"> <li>- Real dry operation (no lube) is possible in all sections where product handling permits. NG is recommended, then.</li> <li>- Cleaning is of major importance regarding service life of chains/belts/ components.</li> <li>- 1/2" belts (e.g. 2120, FlowFlex) offer short head-to-tail transfers.</li> </ul>         |

| <ul style="list-style-type: none"> <li>- LF material is suitable in most cases.</li> <li>- NG material is recommended for abrasive conditions as well as for high speed and/or high load.</li> <li>- LBP chains/belts are recommended for accumulation sections.</li> <li>- High Friction (rubber top) chains/belts are used for inclined conveyors.</li> </ul>    | <ul style="list-style-type: none"> <li>- 1/2" belts (e.g. 2120) are commonly used for all pack arrangement sections.</li> <li>- 1"-Heavy Duty belt (e.g.2251) offers long durability under high load conditions.</li> </ul>  |

## Conveyor length

Conveyor length depends on

- Chain/belt type
- Lubrication
- Product
- Load
- Etc.

| Type                         | Max. advisable length [m] |
|------------------------------|---------------------------|
| Stainless steel, straight    | Approx. 15                |
| Plastic chains, straight     | Approx. 12                |
| Stainless steel, sideflexing | Approx. 9 - 12            |
| Plastic chains, sideflexing  | Approx. 9 - 12            |

These are indicative figures.

In any case it is recommended to double check the conveyor length by calculating the resulting chain pull.

A phenomenon called **slip stick effect** occurs unpredictably. It depends on speed, load, construction and lubrication. Pulsating dynamic forces are the result and affect the service life of all components of a conveyor. More importantly it influences product handling in a negative way.

Long conveyors should be avoided in such cases.

Long conveyors result in high chain load, which affects many components of the conveyor and their wear life.

## Conveyor speed

Maximum speed in m/min

| Type  | Lubrication     |       |              |
|---|-----------------|-------|--------------|
|   | Dry             | Water | Water & soap |
| Stainless steel, straight                       | Not recommended | 70    | 130          |
| Stainless steel, Magnet System, TAB             | Not recommended | 40    | 130          |
| Plastic chains, straight                        | 80              | 100   | 150          |
| Plastic chains, sideflexing, Magnet System, TAB | 50              | 90    | 130          |
| Plastic belts, straight                         | 80              | 100   | 150          |

Under abrasive or high load conditions the maximum speed is reduced.

Higher speed causes higher wear in any case.

For higher wear resistant materials contact our technical support.

## Sprocket position for belts

| Nominal belt width      |                         | Recommended number of sprockets/ idler wheels |
|-------------------------|-------------------------|---|
| Series 2120, 2250, 2251 | Series 2121, 2190, 2252 |   |
| 85                      | 3" (76.2 mm.)           | 1   |
| 170                     | 6" (152.4 mm.)          | 2   |
| 255                     | 9" (228.6 mm.)          | 3   |
| 340                     | 12" (304.8 mm.)         | 4   |
| 425                     | 15" (381 mm.)           | 5   |
| 510                     | 18" (457.2 mm.)         | 6   |
| 595                     | 21" (533.4 mm.)         | 7   |
| 680                     | 24" (609.6 mm.)         | 8   |
| 765                     | 27" (685.8 mm.)         | 9   |
| 850                     | 30" (762 mm.)           | 10  |
| 935                     | 33" (838.2 mm.)         | 11  |
| 1020                    | 36" (914.4 mm.)         | 12  |
| 1105                    | 39" (990.6 mm.)         | 13  |
| 1190                    | 42" (1066.8 mm.)        | 14  |
| 1275                    | 45" (1143 mm.)          | 15  |
| 1360                    | 48" (1219.2 mm.)        | 16  |
| 1445                    | 51" (1295.4 mm.)        | 17  |
| 1530                    | 54" (1371.6 mm.)        | 18  |
| 1615                    | 57" (1447.8 mm.)        | 19  |
| 1700                    | 60" (1524 mm.)          | 20  |
| ect.                    |                         |   |

Fix only one sprocket (centre sprocket), if the belt is running without positioners or any other lateral guide.

## Sprockets and idler wheels

For detailed information about the different types of sprockets, please refer to the chain/belt catalogue.

For the positioning of the sprockets, the horizontal and vertical position relative to the shaft is important for both sprocket and idler to ensure a smooth running of the chain at minimum noise level.

**Sprocket:**

**Idler:**

When matching sprockets for chains to sprockets for belts, the corresponding number of teeth can be chosen depending on the dimension centre of shaft to the top of the chain/belt (RCTP) or the top of the wear strip (S).

In the below table matching sprockets can be found below each other.

| Chain type |      |  |       | Top of chain / belt matching approximately |        |        |        |        |        |        |        |  |
|------------|------|--|-------|--|--------|--------|--------|--------|--------|--------|--------|--|
| 815        | Z    | teeth number                               |       | 17   | 19     | 21     | 23     | 25     |        | 27     | 29     |  |
|            | H    | pitch diameter                             |       | 105.47                                     | 117.34 | 129.26 | 141.21 | 153.21 |        | 165.20 | 177.24 |  |
|            | RCTP | top of chain to center of sprockets        |       | 59.34                                      | 65.27  | 71.23  | 77.21  | 83.21  |        | 89.20  | 95.22  |  |
| 820        | Z    | tooth number                               |       | 17   | 19     | 21     | 23     | 25     |        | 27     | 29     |  |
|            | H    | pitch diameter                             |       | 105.47                                     | 117.34 | 129.26 | 141.21 | 153.21 |        | 165.20 | 177.24 |  |
|            | RCTP | radius top of chain to center of sprockets |       | 59.94                                      | 65.87  | 71.83  | 77.81  | 83.81  |        | 89.80  | 95.82  |  |
| 2250       | Z    | teeth number                               | 12    | 14   |        | 16     | 18     |        | 20     |        |        |  |

|            | S | radius top of wear strip to center of sprockets |  | 44.30                                    | 52.37  |        | 68.51  | 72.54  |  | 76.58  |        |

## Shafts:

Stainless steel is recommended in every case.

Sufficient hardness (> 25 HRC) as well as smooth surface (<0.6 µm) is recommended.

For chains usually round shafts are used, for belts round or square shafts.

Shaft tolerance is usually H7

Key seats are made according to DIN 6885

## Curve systems

A chain has to be kept in a curve to avoid the chain to jump up from the curve.  
There are 3 different curve systems commonly in use:

### Bevel:

### Tab:

### Magnetic:

There can be different arguments when choosing a curve system:

- cost
- cleanability
- easy maintenance
- security
- possible presence of foreign particles
- abrasive conditions
- inspector demands
- side transfers
- etc.

### Comparison of corner systems:

|                                   | Bevel | TAB | Magnetic |
|-----------------------------------|-------|-----|----------|
| Secure chain retention:           | +     | +++ | ++       |
| Support in return part:           | -     | +   | +        |
| Chain can be lifted for cleaning: | +     | -   | +++      |
| Jamming due to foreign particles: | +     | -   | ++       |

Especially with instable products and a multiple strand situation Bevel and Tab have a disadvantage: the link is lifting somewhat in the curve creating a 'step' between the individual strands:

With the Magnet system the links remain flat on the curve:

## Load on curves:

When designing a layout, the curves tend to be the limiting factor. The curve adds significantly to the chain pull. The chain pull at the end of the curve is the curve factor times the chain pull at the beginning of the curve. The curve factor 'f' is depending on the angle of the curve and the friction between chain and curve (for further calculations we refer to our calculation program):

Because of this curve factor it's generally better to position a curve close to the idler end rather than close to the drive end. Then the curve adds relatively less chain pull.

In general we recommend to keep the total curve angle in a conveyor below 180°.

The pressure on the inside of the curve increases through the curve and together with the speed of the chain it generates heat. The maximum allowable Pressure and Velocity (speed) together is called PV limit. This is an important factor next to the max allowable chain pull. The generated heat will warm up the curve material and when it gets too warm, it will become softer and wears out fast.

Use the System Plast calculation program to check the load and PV limit in any case.

To maximise the PV limit, System Plast has developed some special curve materials:

## Nolu-S:

Nolu-S is a unique compound of UHMWPE and a solid lubricant. Nolu-S drastically reduces the coefficient of friction whilst maintaining the characteristics of UHMWPE. Nolu-S also has a better thermal conductivity compared to UHMWPE.

### EXTRA curve:

In an EXTRA curve a profiled stainless steel strip is mounted on the inside of the curve.

**Stainless steel strip**

The profiled structure of the stainless steel strip dissipates the heat, has a better resistance and reduces the friction than standard UHMWPE.

Especially in running dry applications with plastic chains, the EXTRA strip reduces the wear because it conducts the heat from the curve much better than plastic material.

The EXTRA execution is also available for a TAB curve and for Powerflex belts.

## Installation:

Curves are generally mounted between stainless steel 'side skirts' and fastened with screws or with bolts and threaded inserts which are optional with the curves.

For curves wider than 3 tracks we recommend to use cross bar supports, to avoid bending of the curve under load.

For a trouble free infeed of the chains, Return Guide Shoes are recommended to be mounted at the infeed of the return part of the curve:

*In case of staggered return, position return guide shoe level to top track:*

## Self cleaning curve:

A special execution of a magnetic curve in circumstances with higher demands on hygiene is the self cleaning curve:

This curve is:

- self draining
- no recontamination in return part
- installation of nozzles possible.

## Drive construction

Usually used for mono-directional applications. Preferred running direction of chain has to be considered.

Usually used for bi-directional applications or when space at the end of the conveyor for a drive construction is limited. Commonly used for off line accumulation tables. Chains without preferred running direction are recommended.

### Wrap around angle $\alpha$ :

Recommended angle on sprockets is  $140^{\circ} \pm 10^{\circ}$ .

Too small angles may result in chain/belt jumping on the sprocket.

Too big angles may result in chain/belt not releasing safely from the sprocket.

### Catenary sag:

Discharges the chain load. Releases chain properly from the sprocket.

### Recommended dimensions.

|            | A<br>mm | B<br>mm | C<br>mm |
|------------|---------|---------|---------|
| Chains     | 400-550 | 500-900 | 50-125  |
| LBP chains | 400-550 | 600-900 | 50-150  |
| Belts      | 500-700 | 600-900 | 50-125  |

Speed, start-up frequency and drive control must be considered for the design of catenary sags. Catenary sag should be checked and adjusted regularly due to chain elongation.

In any case the length of the catenary sag (B) must be longer than dimension A.

Typical catenary sag

## Tensioner

If no proper catenary sag construction is possible, e.g. in case of insufficient space, tensioners are used.

Gravity take up: 5-10 Kg per meter of belt width.  
1-2 Kg per chain strand.

Common tensioner

Common tensioner

## Return part construction

*Recommended roller diameters:*

| Roller type | Chains (mm) |                | Belts (mm)    |                |                |               |                |
|-------------|-------------|----------------|---------------|----------------|----------------|---------------|----------------|
|             |             |                | ½" inch pitch |                | ¾" inch pitch  | 1" inch pitch |                |
|             | LBP         | Other versions | LBP           | Other versions | Other versions | LBP           | Other versions |
| Idler       | > 100       |                | > 19          |                | > 40           | > 50          |                |
| Return      | Guide shoes | > 50           | Guide shoes   | > 50           | > 50           | Guide shoes   | > 50           |
| Deflection  | > 270       | > 50           | > 270         | > 50           | > 60           | > 270         | > 80           |

## Rotating rollers:

- Free rotation required.
- Big diameters recommended.
- Reduced wear of chain/belt.
- Debris is ejected.
- Reduced noise with O-ring/rubber coating.
- Improved grip with rubber coating.
- Improved wear resistance and further improved grip with urethane coating.
- Machined solid versions for heavy duty and hygienic applications.

## Guide shoes:

Radius = 270 mm.

- Suitable for LBP chains/belts.
- Debris is ejected.
- Low noise version available.

## Wear strips "serpentine system":

UHMWPE recommended.

- Reduced noise.
- Full support.

## Chains/belts with high friction surface:

## Transfers

There are different ways of transferring products from one conveyor onto the next. This is depending on lay out, available space, type of product, lubrication situation, self clearing or not, etc.

*Side transfer (see below):*

*90° transfer (see page 31):*

*Head to tail transfer (see page 33):*

The most common transfer is the **SIDE TRANSFER**.

In this situation the products are pushed sideways onto the next conveyor by the side guide. Consequently there's force on the chain/belt square to the travel direction. Therefore the chain/belt needs to be guided sideways. With chains this can be done against the side of the hinge. With belts this can be done with positioners.

Options for positioners:

Example 2250 FT P1

Example 2250 FT P2

Example 2250 FT P2 B

Example 2250 FT P2 BD

The blue line in the principle sketch on the previous page shows that the positioners in this situation should be at the transfer side. Then the position of the belt (and thus the gap between the two belts) at the transfer is fixed. Possible thermal expansion of the belt will be absorbed at the opposite side of the belt.

Thermal expansion factors (f) are:

|                      |                |
|----------------------|----------------|
| LF (Acetal):         | ~ 0.12 mm/m/°C |
| NG (New generation): | ~ 0.13 mm/m/°C |
| PP (Polypropylene):  | ~ 0.15 mm/m/°C |

Calculation:

Expected expansion [mm] =  $W * \Delta T * f$

$W$  = belt width [mm] / 1000

$\Delta T$  = temperature difference ([°C]-21 °C)

To be able to absorb the thermal expansion the belt needs some clearance on the side. Depending on the expected temperature difference the structure should be wide enough to make sure the belt will not get stuck at high temperatures or, in case of low temperatures, be small enough to still support the belt at low temperatures.

The total clearance to be considered is (indicative values):

- 4 mm for belt width < 500 mm
- 6 mm for belt width 500 to 1500 mm
- 8 mm for belt width 1500 to 3000 mm
- 10 mm for belt width > 3000 mm

The standard production tolerance on the width for belts made in polyacetal is +0 / - 0,5%.

## Inliners:

Use a K330 (83,8mm) wide chain on an inliner with pitch 85 mm to reduce the gap between the strands to a minimum. Also use the top of the range chain/belt to secure a smooth transfer over the inliner:

For stainless steel chains: SPSL series

For plastic chains: series 828 in NG material

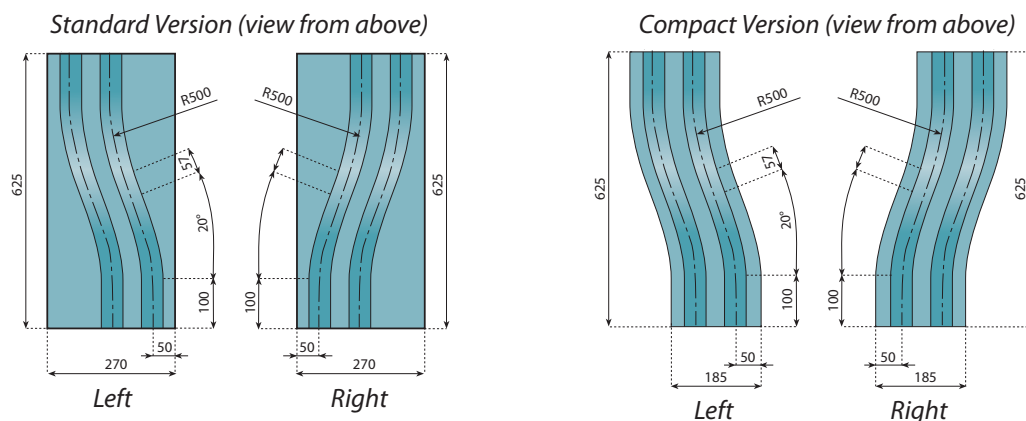

For plastic belts: series 2120 in NG material.

## STM module:

Instead of the products shifting sideways onto the next chain, the chain is shifting from underneath the products. The side guide remains straight and the pressure on the products is less. This transfer system always requires a side flexing chain.

Depending on the construction a standard or a compact version can be used:

Please note that each STM module adds 40° curve to the conveyor. So if an STM module is used on both idler as well as drive end, a total of 80° is added. This should be taken into consideration when calculating the load and PV limit.

Normal catenary dimensions  
see page 24

Important: also when a STM block is used the drive end needs a proper dimensioned catenary sag. This means that the drive shaft should be positioned at enough distance from the STM.

## 90° transfer:

To make a 90° turn in the layout in a small space a **SQUARE TRANSFER** can be used.

The transfer can be done with a dead plate but the line can be made self clearing by using the System Plast Active Transfer Wing:

Active Transfer Wings are available as:

*Single track version or,*

*Connected to full width belt*

The single track version can be positioned at the transfer section (only the last part of the conveyor) and driven by the same motor as the feeding conveyor:

## Active transfer wing with two positioners:

See below overview for the positioning of the active transfer wing relative to the infeed and outfeed conveyor:

This is a system of integrated, tapered flights at the edge of the belt which allows for smooth 90° transfers without dead plates resulting in a self clearing line.

The active transfer system is always equipped with the positioner which ensures an optimum tracking of the belt at the 90° transfer.

We recommend making the return shaft adjustable in X- and Y- direction within a range of some millimeters in order to obtain a perfect transfer.

| BELTS<br>with transfer wing<br>(Ref. n°1) | BELTS<br>(Ref. n°2)               | SPROCKETS<br>Number of teeth Z. | DIMENSIONS |        |        |

| <b>2251 FTTPL2</b>                        | <b>2251 FT<br/>or<br/>2252 FT</b> | 16                              | 104.9      | 58.7   | 58.7   |
|   |                                   | 18                              | 105.6      | 66.7   | 66.7   |
|   |                                   | 20                              | 105.9      | 74.8   | 74.8   |
|   |                                   | 21                              | 106.8      | 78.9   | 78.9   |

The same dimensions are applicable for belts series 2121 and 2252.

Going straight in a narrow space a **HEAD-TO-TAIL** transfer can be used:

The gap between the sprocket and idler can be covered with a dead plate. Depending on the size of the product/pack and the length of the dead plate, it will require some other products/packs to push the first one across the dead plate.

To reduce to length of the dead plate, a smaller sprocket/idler can be chosen. However we do not recommend to work with very small sprockets/idlers because of increased cordal action and small number of teeth in operation.

An option to reduce the pressure necessary to get products/packs across the transfer is the use of roller transfers:

System Plast has 4 types of rollers available:

**Plastic multi**

**Single plastic**

**Plastic with ball bearing**

**SS with ball bearing**

The modules are designed in 3 sizes with 2, 3 or 5 rollers. For further details refer to the components catalogue. See next page for positioning dimensions.

## Combinations

**Head to tail transfer with two modules**

**Note:** where there is no value in the table, but L(3) or L(5), this means that the theoretical length would be more than the length of the module. In that case we recommend to use the next larger size L(3) or L(5).

## Dyna Plate:

There's also a special series "Dyna Plate" with slightly different dimensions and a centre module:

By the use of the centre module the transfer can be elongated in steps of 39 mm to reach the desired transfer length.

## Combinations

|                          | Sprockets Z=16 |      | Sprockets Z=18 |      | Sprockets Z=19 |       |
|--------------------------|----------------|------|----------------|------|----------------|-------|
|                          | H              | L(2) | H              | L(2) | H              | L(2)  |
| 2250 M, 2250 TAB, 2260 M | 55,5           | 89,9 | 113,2          | 63,4 | 93,8           | 114,7 |
| 2251 M, 2251 TAB         | 59,9           | 92,1 | 113,5          | 67,8 | 95,9           | 115,3 |

**Note:** where there is no value in the table, but L(4), this means that the theoretical length would be more than the length of the module. In that case we recommend to use the next larger size L(4).

## Nose bar transfer:

Although roller transfers reduce the pressure required, another option is a solution with only a very small gap. This can be done with a nose bar transfer

The 2120 series belt with 1/2" pitch and concave bottom is very well suited for nose bar transfers. The small pitch and the concave bottom reduce the polygon effect to an absolute minimum.

Either a static nose bar or a roller can be used.

The diameter should be 19-20 mm to fit the concave bottom of the modules.

## Application example:

Recommended drive Construction in nose bar situation:

Dimension A for different 2120 belt types:

| Type ①  | Thickness | Type ②  | Thickness | A  |
|---------|-----------|---------|-----------|----|
| FT / FG | 8.7       | FT / FG | 8.7       | 40 |
| FT / FG | 8.7       | VG      | 10.7      | 42 |
| FT / FG | 8.7       | LBP     | 21.5      | 53 |
| VG      | 10.7      | VG      | 10.7      | 44 |
| VG      | 10.7      | LBP     | 21.5      | 55 |
| LBP     | 21.5      | LBP     | 21.5      | 65 |

## Wear strips

### Construction:

There are different ways of supporting a chain or belt with wear strips:

- parallel support → most common; multiple strands chain/belt;
- full support → in case of heavy load and/or high impact;
- chevron/herringbone → wider belts in abrasive conditions.

### Parallel:

Recommended dimensions:

W= width of the wear strip  $\geq 40$  mm

P= pitch of the wear strips: with K325 or K330 wide chains mostly 85 mm. Larger with wider chains (max 170 mm).  
Or 3"- 6" for imperial belt sizes.

For chains 7,5" and wider we recommend to install 2 wear strips on each side of the hinge. 1 close to the hinge and 1 at the edge of the plate.

Make sure the wear strip is chamfered at the entry side and that there's enough space between the lengths of wear strip to absorb thermal expansion:

$T = \pm 10$  mm. Check thermal expansion rates. See page 29

## CONVEYOR CONSTRUCTION

For belts with positioners, a parallel wear strip system is required.

Wear strip shoes are recommended for a smooth transfer onto the wear strip and reduction of noise:

Further examples:

## Full support:

In case of heavy loads or high impact, it's advisable to support the belt completely. Bear in mind that a full support can also easily collect dust and dirt. Make sure abrasives can leave the system. For reasons of accessibility we recommend to support the return way always with rollers.

## Chevron/Herringbone:

The advantage of this principle is an even wear over the width of the belt. Therefore we recommend this system in abrasive conditions.

*Pitch of wear strips: 100-300 mm.*

## Transfers between commonly used chain types – belts:

When a transfer has to be made from 1 chain/belt type to another, a difference in thickness may have to be absorbed by the wear strips underneath.

*Example: Stainless steel chain 815 to 2250 and 2260M belt:*

## CONVEYOR CONSTRUCTION

The steel chain has a thickness of 3,1mm and the 2250 belt of 8,7mm. That means that the wear strip should absorb 5,6 mm of difference. See below table in red.

See table for other combinations:

| Chain type  | Thickness | Chain type | Thickness | Chain type | Thickness | Belt type | Thickness | Belt type | Thickness |
|-------------|-----------|------------|-----------|------------|-----------|-----------|-----------|-----------|-----------|
| 812         |           | 820 (J)    |           | 831        |           | 2120FT    |           | 2251FT    |           |

## Selection of wear strip material:

| Wear strip material    | Steel chains    | Plastic chains & belts         |                |
|------------------------|-----------------|--------------------------------|----------------|
|                        | lubricated      | dry                            | lubricated     |
| <b>UHMWPE</b>          | recommended     | satisfactory for:<br><60 m/min | recommended    |
| <b>NOLU-S</b>          | possible        | recommended                    | possible       |
| <b>Polyamide</b>       | not recommended | possible                       | possible       |
| <b>Stainless steel</b> | not recommended | recommended                    | recommended    |
| <b>Carbon steel</b>    | not applicable  | possible                       | not applicable |

Temperature limits of wear strip materials must be considered.

### UHMWPE

- to be used in non-abrasive conditions

### NOLU-S

- UHMWPE with built in dry lubricant
- offers even lower coefficient of friction and less noise emission than standard UHMWPE
- basic material properties are similar to UHMWPE

### Polyamide

- to be used in slightly abrasive conditions
- absorption of humidity to be considered

### Stainless steel

- recommended for abrasive conditions
- hardness of 25-30 HRC is recommended
- roughness of max. 1.6µm is recommended

### Carbon steel

- recommended for abrasive conditions
- hardness above 45 HRC is recommended
- roughness of max. 1.6µm is recommended

## Calculation

### Required data for chain/belt calculation:

| Chain/belt and material specification |              |  |
|---------------------------------------|--------------|--|
| Chain/belt type                       |              |  |
| Chain/belt width                      | [mm or inch] |  |
| Curve material                        |              |  |
| Material straight upper part          |              |  |
| Material straight return part         |              |  |
| Product material                      |              |  |

| Product details and conveyor specification |         |  |
|--|---------|--|
| Products/hour                              |         |  |
| Product weight                             | [g]     |  |
| Diameter product                           | [mm]    |  |
| Product arrangement                        |         |  |
| Product pitch                              |         |  |
| Chain speed                                | [m/min] |  |
| Lubrication                                |         |  |
| Number of tracks                           |         |  |
| Sprocket size                              | [teeth] |  |
| Start up frequency                         |         |  |

| Conveyor layout from idler to drive |        |       |        |                           |                         |             |
|-------------------------------------|--------|-------|--------|---------------------------|-------------------------|-------------|
| Section type                        | Length | Angle | Radius | Accumulation <sup>1</sup> | Occupation <sup>2</sup> | Temperature |
|                                     | [mm]   | [%]   | [mm]   | [%]                       | [%]                     | [°C]        |
| 1                                   |        |       |        |                           |                         |             |
| 2                                   |        |       |        |                           |                         |             |
| 3                                   |        |       |        |                           |                         |             |
| 4                                   |        |       |        |                           |                         |             |
| 5                                   |        |       |        |                           |                         |             |
| 6                                   |        |       |        |                           |                         |             |
| 7                                   |        |       |        |                           |                         |             |
| 8                                   |        |       |        |                           |                         |             |
| 9                                   |        |       |        |                           |                         |             |
| 10                                  |        |       |        |                           |                         |             |

<sup>1</sup> Time percentage

<sup>2</sup> Part of the conveyor in accumulation

### Required operation data

Please add a sketch of the conveyor layout.

Please describe operation conditions (e.g. abrasive conditions, chemicals environmental conditions, special operation requirements) in detail.

Please describe product features in detail, add drawings/sketches.

### Replacement of chain/belts

Which chain was used before?

Did it work satisfactory or did problems occur?

Calculation program

## Crate conveying

Commonly there are two ways of conveying crates.

With a single strand stainless steel  $7\frac{1}{2}$ " chain. This chain will have to be lubricated.

Principle sketch of a possible construction.

Especially when running dry two strands of the plastic CC 600 or CC1400/1431 chains can be used.

Principle sketch of a possible construction.

The CC chains tend to be supported and guided in a stainless steel track.  
It is recommended to use UHMWPE wears strips underneath the chain in the stainless steel tracks.

## APPLICATIONS

### Curves:

CC chains are available with or without TAB. The chains can be guided in the curve in different ways:

Full curve with TAB's:

Open curve with TAB's:

Separate guiding strips without TAB's:

Open curve without TAB's

The curve construction should enable easy removal of debris. Also for cleaning purposes an open design is recommended to be able to lift the chain from the curve.

### Transfers:

Depending on the application a dead plate can be used to make the transfer from one conveyor to the other:

But due to the relative large pitch of the CC chains, the transfer of crates goes smoother with a dynamic transfer:

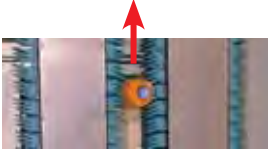

Slave drive:

Staggered conveyors:

## Gripper chains

- Chain tracks must be adjusted parallel. The tolerance for the parallel adjustment of the tracks is  $< 2\text{mm}$ . Incorrect adjustment can lead to overloading and a high wear of gripper-flights as well as of the basic roller chain.
- Gripper ribs must be oriented backwards relative to the running direction of the chain, as shown in the picture.
 
- The control system of the conveyor must assure that no backline pressure is created in order to avoid damage at gripper chains.
- The clearance between the chain tracks must be adjustable. Gripping forces must be adjusted according to the product.  
General rule: as tight as necessary, as loose as possible.  
The product must be removable by hand.
- A tensioning system is necessary. Tension should just take away the play out of the chain.
- Touching products must be avoided – particularly in curving sections. The gap between the products must be big enough.
- Lubrication helps to extend the service life of the chains as well as of the chain guides.
- EXTRA style curves with the stainless steel strip will significantly elongate the service life of the curves.
- Both chain strands must run at the same speed. Any speed differential causes damage at the chain and possibly also at the product. One central drive is recommended.

### Selection of gripper version:

GS1: soft containers, e.g. empty PET bottles, empty cans, non pressurized containers.

GS2: solid containers, e.g. glass bottles, pressurized containers.

GS3: containers with non-cylindrical shape.

GS4: small containers.

### Static electricity

Anti Static (AS) chain and belt material has the following properties: Surface resistivity:  $10^5 \Omega/\text{sq}$   
(According to IEC60093 test method) Volume resistivity:  $10^3 \Omega\text{m}$

In order to avoid sparks:

- It must be assured on site that the electric charge is dissipated to the ground.
- Wear strips must be conductive and grounded.
- Sprockets and idler wheels must be conductive and grounded.

For further information regarding use of our AS chains in hazardous areas please contact our Technical Support.

### Noise reduction

- Use plastic chains/belts instead of steel chains.
- When designing a layout use multiple strand or wider belt running at a lower speed rather than single strand or narrow belt running at higher speed.
- Avoid chain/belt colliding with conveyor parts.
- Reduce speed differentials and thus product impact.
- Use chains/belts with a small pitch (e.g. 2120/2121 belt series).
- Use sprockets with a big number of teeth.
- Adjust sprockets/idlers according to our recommendation in the catalogue (dimension "S"). (See image n°1)
- Use return guide shoes in carry as well as in return part. (See image n°2)
- Use sound-absorbing rubber coated return rollers or serpentine system for full chain/belt support. (See image n°3)
- Use materials with optimized sliding properties (e.g. Nolu-S wear strips, product guides and curves).
- Use our STM transfer instead of dead plate transfers. (See image n°4)
- Use curves instead of dead plate transfers.
- Apply lubrication.

**Image n°3**

**Image n°4**

## Inclined and declined conveyors

Maximum angles to avoid product sliding down on the chain

| Chain type                      | Lubricated | Dry    |
|---------------------------------|------------|--------|
| Stainless steel                 | 4°         | *8°    |
| Plastic chains/belt             | 2.5°       | 4.5°   |
| Rubber top chains steel/plastic | 12/15°     | 15/20° |

\*Dry run with steel chains is generally not recommendable

Pollution on the chain as well as on the product surface influences the maximum angles negatively.

### Drive construction:

Location of drive in order to run chains safely and without roof-building effect.

### Declines:

$\tan(\alpha) > \text{friction coefficient between chain and wearstrips}$   
Soft start/stop is recommended.

$\tan(\alpha) < \text{friction coefficient between chain and wearstrips}$   
Soft start/stop is recommended.

Dynamic tensioner is in both cases recommended.

### Inclines:

Drive is normally located at the upper end.  
Soft start/stop is recommended.

Integrated transfer

Hold down guide, resp. TAB chain

separate transfer  
e.g. with dead plate

### Curve construction in combination with inclines/declines:

Sideflexing chains for Magnetic System can be used in inclined/declined conveyors only under the following restrictions:

Incline is possible before a curve

Decline is possible after a curve

Otherwise the chain could be lifted out.

## Accumulation

Accumulation of products results in increased load on the chain as well as in increased wear on chain/belt and product.

**LBP (Low Back Pressure) chains/belts** are recommended to reduce these effects.

With low noise accumulation rollers the friction and other negative resulting effects are reduced to a minimum.

For the **return part construction** flat surfaces or guide shoes are recommended.

Frequent and thorough cleaning of LBP chains/belts is recommended to make sure that the accumulation rollers run free. Otherwise the advantages of this construction get lost.

Example

## Pressureless combiners

\* K330 (83.8mm) width is recommended because the gap between adjacent chains/belts is reduced to the minimum.  
 \*\* K325 (82.5) width is necessary for sloped pressureless combiners, because of the necessity to mouth separating discs in the return way.

### Suitable chains/belts:

Usually pressureless combiners have a track pitch of 85 mm.

| Type                   |  | Characteristics   | Suitable for                                   |
|------------------------|--|---|--|

### Dry lubrication

There are several developments in the market concerning lubrication.

There's a tendency to try to go away from wet lubrication to either semi-wet lubrication, dry lubrication or completely dry (no lube at all).

In some industries and situations wet lubrication is still the best and easiest to handle lubrication system.

But in a growing number of cases semi-wet lubrication or dry lubrication can be used. Also System Plast continues to develop designs and materials that can handle applications completely without lubrication. Talk to us about your application!

Semi- wet lubrication is fluid like water but should not be mixed with water before applying. This system tends to be used more on stainless steel chains than plastic.

Dry lubrication is most often a mineral oil with a built in lubricant like Teflon or silicon. There are different principles on the market. Check with your supplier for further details.

The amount of dry lubricant that's applied is close to nothing. It forms a thin layer on the chain/belt to get the requested sliding properties. Advantages are obvious. Small amount of lubricant required; no water; no waste water; simple installation; no drip trays, etc.

Dry lubricant is presently used mainly with cartons, bricks, PET bottles and cans at normal line capacities.

There are several suppliers on the market using different products and applying it in different ways:

#### Brushes

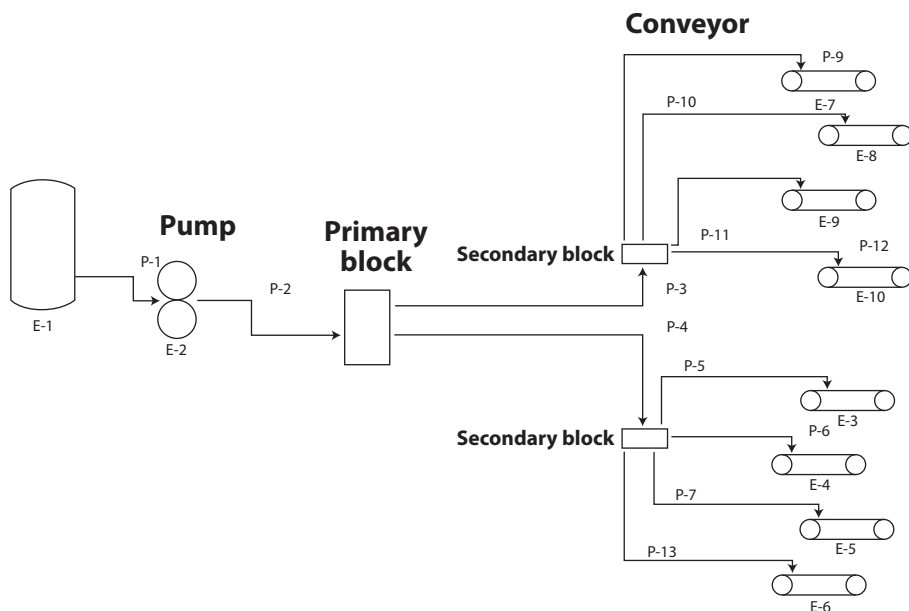

#### Shoes

Nozzles:

Although the different suppliers suggest different ways of bringing the lubricant from buffer to the chains/belts, the basic principle is the same:

Question is how to evenly apply about 5 ml lubricant per hour on the chain/ belt.

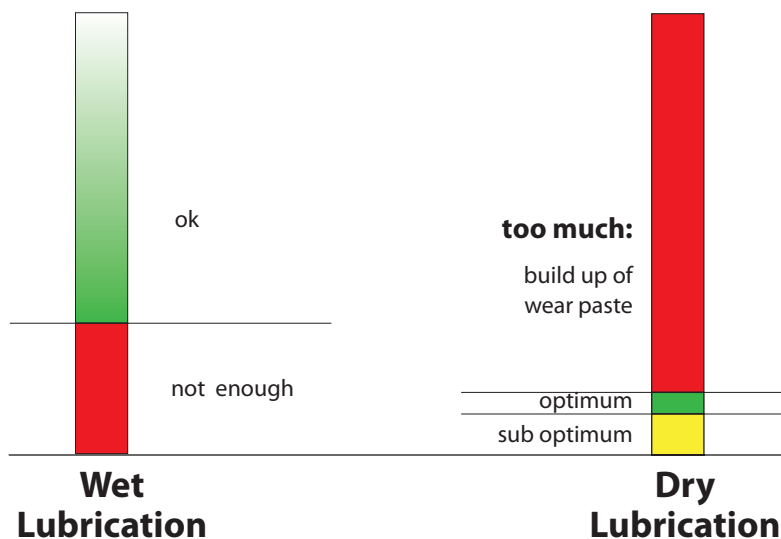

Dry lubrication can bring advantages like:

- Reduction of cost for waste water.
- Reduction of cost for dosing hardware. No drip trays necessary.
- Safety → no slippery floors due to foam of wet lubrication.
- Hygiene → less or no water; no slime build up.
- No corrosion attack on equipment.
- No false rejects due to foam on bottles at inspectors.
- No water/foam on labels.
- No moisture on packaging material.

## APPLICATIONS

But **important is to use it correctly**. Dry lubrication requires a different 'mind-set' compared to wet lubrication:

- Wet lubrication requires a minimum, (..as long as there's minimum 20cm foam on the floor...)
- Dry lubrication requires a maximum (smallest possible; when you see it, it's already too much)

If you don't stay within the green zone, after some time the chain may look like this:

That's why it's very important to take a couple of things into consideration:

Dry lubrication requires maintenance to avoid built-up of pollution, regardless whether it's a system with brushes:

...with shoes:

...or with nozzles:

The responsibilities for maintenance and the lubrication have to be clear and preferably with the same person that's technically responsible for the line.

Dry lubrication has a high potential. But to get the full benefit it's good to take also following effects into consideration:

|                      | Cleaning                        | Product quality                         | Process                                     | Mechanical                        | Factor H                        |
|----------------------|---------------------------------|---|---|-----------------------------------|---------------------------------|
| Dry running          |                                 |   |   |                                   |                                 |
| Dry lubrication      | More dedicated<br>↑<br>End user | Higher influence<br>↑<br>End user / OEM | Engineering mind set<br>↑<br>End user / OEM | Details are important<br>↑<br>OEM | Human factor<br>↑<br>End - user |
| Semi wet lubrication |                                 |   |   |                                   |                                 |
| Wet lubrication      |                                 |   |   |                                   |                                 |

See further explanation on the next pages.

### Cleaning:

The cleaning regime needs to be re-evaluated when going away from wet lubrication because:

- Wet lubricant has also cleaning effect
- More dedicated cleaning is required f.e. where product loss occurred

### Product quality:

The type and quality of the material has an influence on the behaviour on the conveyors like:

- |                               |                        |                            |
|-------------------------------|------------------------|----------------------------|
| • Quality of PET              | • Quality of Cans      | • Quality of Glass         |
| - Raw material                | - Steel/ aluminium     | - Raw material; origin     |
| - Colorants                   | - Painted or varnished | - New or returnable        |
| - Blockers                    | - Design               | - Design                   |
| - Other additives             | - Material thickness   | - Surface finish of bottle |
| - Design/ settings of machine |                        |                            |

### Process:

When designing a layout please bear in mind that the line is going to run without wet lubrication. Think about:

- Wider conveyors → slower speed
- Longer inliners/outliners
- Shorter buffer sections → Back Line Pressure
- Optimised line controls
- Larger radius curves

### Mechanical:

Some small mechanical issues on conveyors that seem not to create problems need to be addressed when going away from wet lubrication. Make sure that the chains/belts are running completely free (without obstruction).

Some points of attention:

- Nolu-S wear strips and curves with built-in lubricant can replace the wet lubrication to a certain extent.
- Perfect alignment of different sections.
- Smooth transfers of wear strips.
- Stable and straight side guides at right position.
- Positioning of sprockets and idlers.
- Smooth transfer straight into curve.

### Factor H:

The most important factor is the Human Factor: the people that are dealing with the line.

- How do the local people deal with the line?
- Who's responsible?
- How are the contracts made?
- 'Mind set' change when reducing lubrication!
- Never mix products! → f.e. teflon spray in combination with dry lubricant creates high friction

## So, is Dry Lubricant a good idea?

- Yes, in a good number of cases it brings interesting advantages.
- But be aware of the down side to get the full benefit!

## Completely dry may be better?

- In certain areas of the bottling line and certain products: yes
  - Depalletiser + outfeed conveyors
  - Labelling, coding and packaging areas
  - Cans and PET and even glass
  - Beware of abrasives & chemicals

**System Plast** continues to develop products and materials that are able to run well even **completely dry** in certain circumstances like:

- Nolu-S wear strip / curve / side guide material
- NG chain material
- 828 chain design
- 'extra' curve design with metal strip
- Maintenance free bearings and TPM/SMED products that require less attention.

**In any case, since every situation is different, please contact our specialists.**

### Powerflex

#### Calculation information:

Powerflex modular side flexing belts are used design to convey packs and boxes. In most applications the load on the belt can be relatively high because:

- The products are heavy
- There is usually no lubrication
- Many times the belts has to make a 180° turn
- In the curve there is only a limited part of the belt (only the outer part) that is pulling.

Therefore it is very important that every application of a side flexing belt is calculated prior to fixing the final layout of the line. Our Technical Support department will be glad to assist you with the calculations.

#### Conveyor layout:

When you are implementing a conveyor with a side flexing belt in a layout, there are several things to consider. If possible we recommend positioning the curve close to the idler end rather than close to the drive side. This will reduce the forces on the belt in the curve. Once the belt is on the straight section between the last curve and the drive end, there usually is no problem to add some length to the conveyor. On the straight section the strength of the belt is quite high.

We have some recommendations regarding the minimum straight section before, after and in between curves. See following illustration.

Length of straight section 'drive end':  
1 x belt width with a minimum of 800mm

Length of straight section 'idler end':  
1 x belt width with a minimum of 500mm

Length of straight intermediate section for  
S-curves with 2351 type belt:  
Minimum 1.5 x belt width

Curve radius R:  
See tables below

| Minimum inside curve radius R |      |      |      |      |
|-------------------------------|------|------|------|------|
| Width                         | 2351 | 2451 | 2551 | 2651 |
| 255                           | 408  | -    | -    | -    |
| 340                           | 545  | 545  | 340  | -    |
| 425                           | 680  | 680  | 425  | 425  |
| 510                           | 840  | 840  | 510  | 510  |
| 595                           | 980  | 980  | 595  | 595  |
| 680                           | 1150 | 1150 | 680  | 680  |
| 765                           | 1300 | 1300 | 850  | 850  |
| 850                           | 1450 | 1450 | 1050 | 1050 |

## Construction details:

### Straight tracks:

The design is similar to commonly applied standard constructions.

Example:  
end drive and serpentine return

B = belt width, example 425 mm

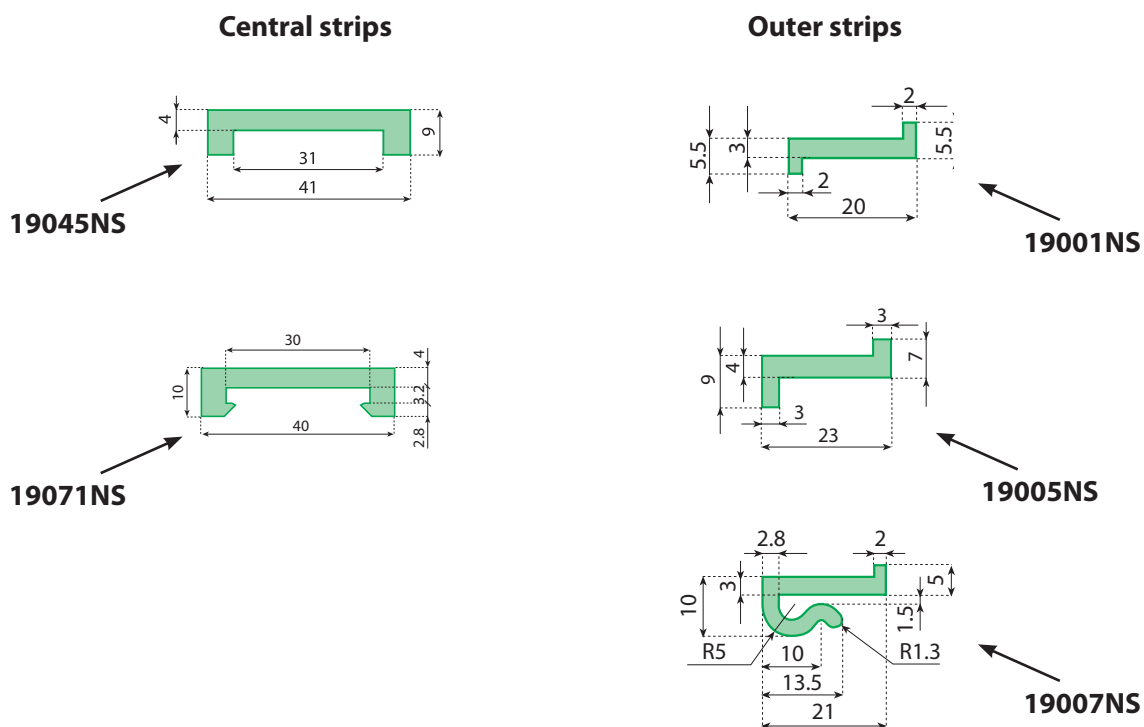

C = conveyor width, example  $425 + 10(\text{inside}) + 10(\text{outside}) = 445$  mm net (side frame thickness not considered)

Note that a catenary sag is required directly after the drive in the return part.

## Wear strips:

On the straight track any existing wear strip from our extensive range can be used (see catalogue 'Conveyor Components').

Examples:

For good sliding properties Nolu-S material is recommended. This reduces the chain pull and extends the service life.

A possible cross section design of straight carry and return part is this:

For location of TABs and other dimensions refer to catalogue.

Return rollers with rubber coating offer low noise and extended service life.

Since the belts are made with a modular width system of 85mm, it is recommended to use this system for the wear strip arrangement as well.

## Curve tracks:

There are three options:

1) Dedicated guiding profile for standard or Heavy duty belt types.  
This is fixed to the metal frame construction.  
These Nolu-SR profiles are available in 3 meter lengths.

2) Solid machined curve.  
This can only be offered on request and according to customer's drawing.  
Principle is similar to existing TAB curves for TAB chains.  
See further notes regarding the curve return part.

3) Side guiding profiles for 2351 series belt without TAB.  
When a belt without TABs is used, it needs to be guided at both sides.

## Material:

We recommend Nolu-SR material for its high wear resistance and at the same time excellent sliding properties.

Other options are:

- Extra strip: A stainless steel wearstrip fitted into a plastic curve  
Proven excellent performance in dry applications and dirty environments.
- Standard UHMW-PE material: For lubricated applications with low wear expected.

### Taking the belt out of the curve:

The conveyor construction must offer enough space to lift the TABs out of the track.

A clearance of at least 10 mm for standard belts and 6 mm for Heavy Duty belts is recommended to move the belt towards the outside of the curve.

### Infeed/Outfeed:

It is strongly recommended to extend the curve tracks into the straight sections in order to run the belt smoothly into and out of the curve.

An infeed chamfer also of the outer plastic curve or wearstrip material is recommended for smooth running. Make sure that there is a proper chamfer both horizontal as well as vertical.

Cut like this

## Curve return part:

### 2351 series with two TABs:

For belt widths up to 425 mm a full curve like this is possible.

Serpentine wearstrips are required for belts wider than 425mm.

### All Powerflex series with one TAB:

Supporting serpentine wearstrips are necessary

When a full curve is used, supporting return rollers or serpentine wearstrips are required for belts wider than 425mm.

In any case, make sure that the belt does not touch the inner edge of the conveyor construction. A clearance of 10mm is recommended.

Since the belt is guided at the outside, any width expansion will be transferred towards the inside of the curve.

## SIDEFLEXING BELTS

### Guide profiles:

#### 2351 and 2551:

|           | Min. radius for 2351 |      | Min. radius for 2551 |      |
|-----------|----------------------|------|----------------------|------|
| Width (W) | R (TAB)              | R(m) | R (TAB)              | R(m) |
| 255       | 634.5                | 616  | -                    | -    |
| 340       | 856.5                | 838  | 651.5                | 633  |
| 425       | 1076.5               | 1058 | 821.5                | 803  |
| 510       | 1321.5               | 1303 | 991.5                | 973  |
| 595       | 1546.5               | 1528 | 1161.5               | 1143 |
| 680       | 1801.5               | 1783 | 1331.5               | 1313 |
| 765       | 2036.5               | 2018 | 1586.5               | 1568 |
| 850       | 2271.5               | 2253 | 1871.5               | 1853 |

R(m) = outside edge of the mating part to which the guide profile is mounted

#### 2451 and 2651:

|           | Min. radius for 2451 |      | Min. radius for 2651 |      |
|-----------|----------------------|------|----------------------|------|
| Width (W) | R (TAB)              | R(m) | R (TAB)              | R(m) |
| 340       | 850                  | 838  | -                    | -    |
| 425       | 1070                 | 1058 | 815                  | 803  |
| 510       | 1315                 | 1303 | 985                  | 973  |
| 595       | 1540                 | 1528 | 1155                 | 1143 |
| 680       | 1795                 | 1783 | 1325                 | 1313 |
| 765       | 2030                 | 2018 | 1580                 | 1568 |
| 850       | 2265                 | 2253 | 1865                 | 1853 |

## Sprocket positions and supporting wheels:

Since these belts are not symmetrical to the middle axis, please note that the precise sprocket position also depends on the running direction of the belt. The right position for both directions is given in the sketches below. For belt series 2451, 2551 and 2651 the offset must also be considered when the belt curve direction is changed (clock-wise / counter-clock-wise).

Note: Precise position of the sprockets must be determined during the installation to obtain optimum alignment.

### 2351 series:

Example 425 mm wide:  
4 sprockets

Centre distance 85

First sprocket located  
at 80/90 mm from the edge.

Sprockets can be located  
over the whole width of the  
belt between the TABs.

## SIDEFLEXING BELTS

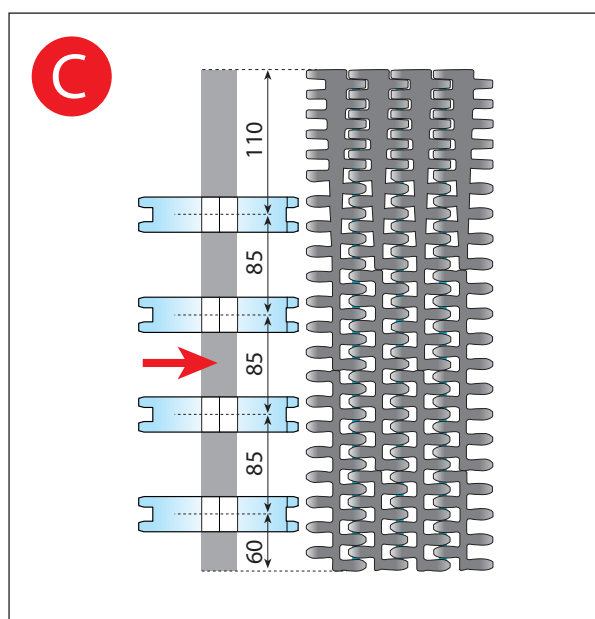

### 2451 series:

Example 425 mm wide:  
4 sprockets

Centre distance 85

First sprocket located  
at 100/110 from the  
TAB-end edge.

Sprockets can be located  
over the whole width of the  
belt except of the 85 wide  
carry modules track.

## 2551 series:

Example 425 mm wide:  
3 sprockets

Centre distance 85

First sprocket located  
at 80/90 from the  
TAB-end edge.

'Zig-zag' small radius part  
should be clear from  
sprockets.

Sprockets can be located  
over the whole width of the  
belt between the TAB on  
one side and the small radius  
modules on the other side.

# SIDEFLEXING BELTS

## 2651 series:

Example 425 mm wide:  
3 sprockets

Centre distance 85

First sprocket located  
at 90/100 from the  
TAB-end edge.

Sprockets can be located  
over the whole width of the  
belt between the carry module  
track one side and the small radius  
module track on the other side

In case of interference with wearstrips other sprocket positions can be chosen. Please consult Technical Support for the available options.

## Recommended number of sprockets and idler wheels, summary:

| Width (mm) | series |      |      |      |
|------------|--------|------|------|------|
|            | 2351   | 2451 | 2551 | 2651 |
| 255        | 2      | -    | -    | -    |
| 340        | 3      | 3    | 2    | -    |
| 425        | 4      | 4    | 3    | 3    |
| 510        | 5      | 5    | 4    | 4    |
| 595        | 6      | 6    | 5    | 5    |
| 680        | 7      | 7    | 6    | 6    |
| 765        | 8      | 8    | 7    | 7    |
| 850        | 9      | 9    | 8    | 8    |

## Sprocket engagement and installation:

Sprockets engage on the curved end of the hinges.  
The teeth of the sprocket must push the highlighted surface of the hinges.  
That is important for the installation of sprockets.

### Reverse operation:

Special sprockets can be supplied on request.

Middle/standard modules are designed for sprocket interaction.  
High torque transmission by means of optimized tooth geometry.

In order to avoid the belt from deflecting in areas where there's no sprocket, it is recommended to install a supporting wheel.

To calculate the diameter of the supporting wheel use the following rule:  
 $D = C - 12.7$   
 C = pitch circle diameter of the sprocket

## Fixed and floating sprockets:

It is recommended to fix the sprocket which is located closest to the outside track of the curving belt. The other sprockets can be floating using a 'Plus bore'. See further details in our Chains and Belts catalogue.

## Drives:

End drives are the easiest way to drive the side flexing belts. However, centre drives are possible as well. For centre drives some special construction rules apply. Please refer to the relevant chapter in this manual.

For sprocket and idler dimensions the following is important:

Smallest positive wrap around diameter: 60 mm

Smallest diameter of deflection roller: 80 mm

## FlowFlex

### 2120M - 1/2" Side-Flexing chain-belt plus accessories

#### Design:

Plate thickness: 8.7mm

Pitch: 12.7mm (1/2")

Width: 83.8mm

Side-flex radius: 500mm

Radius underneath plate: 9.5mm

Track pitch system: 85mm

Curve retention system: magnetic

Materials: all plastic materials according to material table

Pins: stainless steel

Pin locking system: clip at one side

#### Other Features:

- Runs on the same sprockets as our straight running 1/2" belts (e.g. 2120).
- Runs nearly without polygon-effect around nosebars and idler shafts.
- Suitable for end drive as well as for centre drive.

#### Applications:

This side-flexing chain-belt was designed for applications that require a maximum of product support.

- Continuously running belt.
- Short head-to-tail transfers.
- Small gaps between adjacent tracks.

At the same time it was designed to reduce conveyor and maintenance costs.

- Less conveyor length.
- Less product guide length.
- Less required installation space.
- Less required time for conveyor conversions (product change).

conventional layout

layout with flowflex

*Side transfer*

*Linear transfer with FlowFlex*

These features make this chain-belt suitable for a whole variety of applications.

- Difficult to handle products (non-cylindrical shape).
- Instable products (small diameter, high centre of gravity).
- Running a line empty.
- Low speed conveying as well as high speed single track conveying

*Side transfer*

*Linear transfer with FlowFlex*

## Complete System:

The FlowFlex system contains:

- The chain-belt 2120M
- Sprockets out of the standard 2120 range
- Nosebars – see corresponding chapter in this engineering manual
- Magnetic curves – see corresponding chapter in this engineering manual

## Conveyor Design for FlowFlex:

- Straight sections just require the standard conveyor design.
- The belt is sliding on the wear strips just like a modular belt.
- In order to guide the belt, wear strips with guide rail on top are recommended.
- For single track application the commonly used side-wear strips are recommended.
- For curving sections first of all our magnetic corner tracks are recommended. They fit exactly the chain-belt and offer maximum chain retention.
- Connection between curve and straight sections also require just the standard design.
- Return part design also just requires the standard design.
- Drive and catenary design is exactly like with straight running ½" belts.

## Product handling

### Forces due to acceleration:

The force necessary to accelerate the chain and products is calculated by:

$$F = M * a$$

F= force in [N]

M= mass of chain and product in [kg]

a= acceleration in [m/s<sup>2</sup>]

This extra force is working not only on the chain but also on the bearings, the drive unit and the structure. Frequent start-stops create an extra fatigue load on the chain and thus shorten the life time of the chain. In the calculation there's a factor included depending on number of start-stops per hour. Soft starts or frequency controllers are always advisable. Not only for the life time of the chain but also for smoother product handling and avoiding problems at start-up with products particularly unstable.

### Maximum acceleration:

The max acceleration force on a product to be able to 'take along' the product with the chain is depending on the friction between product and chain. Maximum acceleration  $a_{\max}$  can be calculated with:

$$a_{\max} = \frac{F_{\max}}{M} = \frac{W * \mu}{M} = \frac{M * g * \mu}{M} = g * \mu$$

W = weight of product in [N]

M = weight of product in [kg]

$\mu$  = coefficient of friction between chain and product

g = gravitational acceleration = 9.81 m/s<sup>2</sup>

### Maximum force on products to avoid tippage:

The maximum acceleration without products falling over is depending on the shape (position of centre of gravity), the weight and the material of the product.

This is for instance also important when the product is being conveyed onto a dead plate.

See below sketch:

The force F is the force due to acceleration or deceleration of the product ( $F=M*a$ ), or due to a different cause like other bottles or a side guide.

The bottle will tip over when the angle  $\beta$  is larger than angle  $\alpha$ .

Angle  $\alpha$  is determined by the diameter of the foot print of the product ( $B= \frac{1}{2} * \text{diameter}$ ) and the height of the centre point of gravity ( $=A$ ).

Angle  $\beta$  is determined by the horizontal force on the bottle ( $= F$ ) relative to the weight of the bottle ( $= G$ ).

The max force F is found by following formula:

$$\frac{F_{\max}}{G} = \frac{B}{A} \rightarrow F_{\max} = G * \frac{B}{A} \quad \text{or} \quad \begin{array}{l} \mu < \frac{B}{A} \rightarrow \text{OK} \\ \mu > \frac{B}{A} \rightarrow \text{not OK} \end{array}$$

MSV= maximum speed variation

$$MSV = \sqrt{2 * g (\sqrt{H^2 + B^2} - H)}$$

## Centrifugal forces:

When a product is being conveyed through a curve there's a centrifugal force working on the product. This force on the product is compensated by the friction between chain and product and by a side guide.

The centrifugal force is calculated with:

$$F_c = \frac{M * v^2}{r}$$

M= weight of the product

v = speed

r = centre radius of the curve

Friction force between chain and product is calculated with:

$$F_m = M * g * \mu$$

g = gravitational acceleration

$\mu$  = coefficient of friction between chain and product.

The minimum force F that needs to be generated by the side guide is:

$$F = F_c - F_m = M * \left[ \frac{v^2}{r} - g * \mu \right]$$

### Pressure of accumulating products:

When a product is standing still (e.g. against a stopper or guide), the chain running underneath the product creates a force on the product equal to the weight of the product multiplied by the coefficient of friction between chain and product.

Each following product is pushing with the same force against the next product, so the resulting force is proportional to the total weight of products upstream.

$$F_a = W_a * L_a * \mu$$

$F_a$  = accumulation force

$W_a$  = weight of the accumulating products in Kg/m.

$L_a$  = length of accumulation in m

$\mu$  = coefficient of friction between chain and product.

### Side transfer action:

Pushing the product sideward creates a force  $F$  on the product against the side guide.

$$F = F_a * \sin(\alpha) = W_a * L_a * \mu * \sin(\alpha)$$

(see explanation of symbols above)

Nowadays cans and bottles are becoming thinner and thinner. At the same time more and more installations are running with less or no lubrication and thus increasing the coefficient of friction. That's why it's important to take also these forces on the products into consideration.

In the above mentioned formula the angle  $\alpha$  plays an important role in a smooth transfer and reduced forces on the products. This angle should be kept as small as possible.

## 90° product transfer:

When transferring products from one conveyor to another at 90° angle, it's common practice to use full radius guide rails with dead plates which span the space between the infeed and outfeed conveyors. Products moving along the full radius guide rail exert high pressure on the rail and on each other, easily resulting in damage.

The parabolic guide rail distributes the pressure better along the outer guide rail. This results in significantly less potential for damage on products. However on the inside of the curve extra room must be created for a 'dead area'. The use of the Systemplast active transfer wing system will eliminate the dead plate and further reduce the pressure on products and side guides.

## Bearings and shafts

### Forces on bearings and shafts:

After calculating the pull force at the drive end per strand of chain, we can calculate the total pull on the shaft  $T_s$ . If we look at the setup with the drive unit above the conveyor with a roller chain transferring the power to the drive shaft the field of forces looks like:

$H$  = Horizontal force

$V$  = Vertical force

$H_1 = H_2 = T_s/2$

Drive ratio  $R = d_1/d_2$

$V = T_s * (D_p/d_2)$

$D_p$  = sprocket pitch diameter

$V_1 = V + V_2$

$V_2 = V * (l_1/l)$

$T_s$  = Total pull

$F_{r1}$  gives the highest load on the bearing on the side of the drive unit and can be calculated from  $V_1$  and  $H_1$ :

$$F_{r1} = \sqrt{H_1^2 + V_1^2} = \sqrt{\left[\frac{T_s}{2}\right]^2 + T_s^2 * \frac{D_p^2}{d_2^2} * \left[1 + \frac{l_1}{l}\right]^2} \quad [N]$$

If the specific conveyor has a head-to-tail transfer you can include the weight of the products in the vertical load on the shaft. However normally speaking this load is relatively low compared to the load generated by  $T_s$ .

## Shaft size:

The shaft must fulfil the following conditions:

- max shaft deflection under full load ( $F_w$ ).  $f_{max}$  is 2.5 mm. If the calculated shaft deflection exceeds this max value, select a bigger shaft size or install an intermediate bearing on the shaft.
- Torque at max load must be below critical value

Shaft deflection can be calculated with following formula:

$$2 \text{ bearings: } f = 0.013 * F_w * \frac{l_b^3}{E * I} \text{ [mm]}$$

$$2 \text{ bearings: } f = \frac{1}{370} * F_w * \frac{l_b^3}{E * I} \text{ [mm]}$$

For uni-directional head drive  $F_w = T_s$

For bi-directional centre drive  $F_w = 2 * T_s$

For uni-directional pusher drives  $F_w = 2.2 * T_s$

## GENERAL CALCULATION

| Shaft size [mm] | Inertia [mm <sup>4</sup> ] |
|-----------------|----------------------------|
| Ø20             | 7850                       |
| Ø25             | 19170                      |
| Ø25             | 32550                      |
| Ø30             | 39751                      |
| Ø35             | 73643                      |
| Ø40             | 125660                     |
| Ø40             | 213330                     |
| Ø60             | 636170                     |
| Ø60             | 1080000                    |
| Ø90             | 3220620                    |
| Ø90             | 5467500                    |

| Shaft materials                 | Modulus of elasticity E | Shearing strength    | Possible material specifications |
|---------------------------------|-------------------------|----------------------|----------------------------------|
|                                 | [N/mm <sup>2</sup> ]    | [N/mm <sup>2</sup> ] |                                  |
| Carbon steel                    | 206000                  | 60                   | St 37-2, St 37                   |
| Stainless steel (low strength)  | 195000                  | 60                   | X5CrNi18 10, AISI 316, 304       |
| Stainless steel (high strength) | 195000                  | 90                   | X12CrNi17 7, AISI 301            |
| Aluminium                       | 70000                   | 40                   | AlMg, AA 5052                    |

The torque on the shaft is calculated with:

$$T_{\max} = F_w * \frac{d_p}{2} * 10^{-3} \quad [\text{Nm}]$$

$T_{\max}$  = maximum torque  
 $T_{\text{adm}}$  = admissible torque

$$T_{\text{adm}} = \eta_{\text{adm}} * \frac{d_w^3}{5000} \quad [\text{Nm}]$$

$\eta_{\text{adm}}$  = admissible shearing strength [N/mm<sup>2</sup>]

for max. admissible shearing strength see table below:

| Maximum allowable torque |                   |                      |
|--------------------------|-------------------|----------------------|
| Shaft diam. [mm]         | Carbon steel [Nm] | Stainless steel [Nm] |
| Ø20                      | 94                | 141                  |
| Ø25                      | 184               | 276                  |
| Ø30                      | 318               | 477                  |
| Ø40                      | 754               | 1131                 |
| Ø45                      | 1074              | 1610                 |
| Ø50                      | 1473              | 2209                 |
| Ø55                      | 1960              | 2940                 |
| Ø60                      | 2545              | 3817                 |
| Ø80                      | 6032              | 9048                 |
| Ø90                      | 8588              | 12882                |

## Bearing calculations for series UC and UF:

### Static load calculation:

In case the bearing is loaded without rotating, very slowly rotating or is making a slow oscillating movement the bearing power is not determined by the fatigue life of the material but by the deformation of the rollers and the groove.

This calculation is also valid if at a fraction of the rotation a shock load is present.

$$P_0 = X_0 * F_r + Y_0 * F_a$$

$$= 0.6 * F_r + 0.5 * F_a$$

$P_0$  = equivalent static load [N]

$X_0$  = radial static factor

$F_r$  = radial load [N]

$Y_0$  = axial static factor

$F_a$  = axial load [N]

$P_0$  is calculated when there is not only a radial component in the load but also an axial component. When the load on the bearing is strictly radial the equivalent static load  $P_0 = F_r$ .

The minimum static load coefficient  $C_0$  is calculated taking into account the static safety factor  $S_0$ . Then in the bearing tables the right size bearing can be found checking the  $C_0$ .

$$C_0 = s_0 * P_0$$

$C_0$  = static coefficient in [N]

$S_0$  = static safety factor = 1 for normal circumstances

= 1.5 when vibrations are involved

= 2-2.5 for noiseless applications.

## GENERAL CALCULATION

### Dynamic load calculation:

For normal circumstances the dynamic load coefficient is calculated and compared to the equivalent dynamic load to determine the theoretical life time of the bearing.

The calculated life time is then compared to the standard for the application and industry.

According to ISO 281, the dynamic load coefficient indicates the bearing load under which the bearing will last at least the nominal  $1 \cdot 10^6$  rotations. Taken the load is constant and radial.

$$L_{10} = \left( \frac{C}{P} \right)^3$$

$L_{10}$  = nominal life time in millions of revolutions

$C$  = dynamic load coefficient in [N]

$P$  = equivalent dynamic load [N]

When the load on the bearing is strictly radial the equivalent dynamic load  $P = F_r$ .

When there's also an axial load involved the equivalent dynamic load is:

$$P = X * F_r + Y * F_a$$

$X$  = radial dynamic factor

$Y$  = axial dynamic factor

The axial force only influences the equivalent dynamic load when  $F_a / F_r > e$

| Calculation factors |      |                 |     |                 |     |
|---------------------|------|-----------------|-----|-----------------|-----|
|                     |      | $F_a / F_r < e$ |     | $F_a / F_r > e$ |     |
| $F_a / C_0$         | $e$  | $X$             | $Y$ | $X$             | $Y$ |
| 0.025               | 0.22 | 1               | 0   | 0.56            | 2   |
| 0.04                | 0.24 | 1               | 0   | 0.56            | 1.8 |
| 0.07                | 0.27 | 1               | 0   | 0.56            | 1.6 |
| 0.13                | 0.31 | 1               | 0   | 0.56            | 1.4 |
| 0.25                | 0.37 | 1               | 0   | 0.56            | 1.2 |
| 0.5                 | 0.44 | 1               | 0   | 0.56            | 1   |

**The axial load should never exceed 20% of  $C$**

For the **support series F and FC** carrying the double row roller bearings 1205 -1208 the calculations are as follows:

Combined static load:

$$P_0 = F_r + Y_0 * F_a$$

Combined dynamic load:

When  $F_a/F_r < e \rightarrow$

$$P_0 = F_r + Y_1 * F_a$$

When  $F_a/F_r > e \rightarrow$

$$P_0 = 0.65 * F_r + Y_2 * F_a$$

| Bearing type | e    | Y <sub>0</sub> | Y <sub>1</sub> | Y <sub>2</sub> |
|--------------|------|----------------|----------------|----------------|
| 1205         | 0.28 | 2.4            | 2.3            | 3.5            |
| 1206         | 0.24 | 2.8            | 2.6            | 4.1            |
| 1207         | 0.23 | 2.9            | 2.7            | 4.2            |
| 1208         | 0.22 | 3              | 2.9            | 4.4            |

## Indicative speed for shaft tolerances:

| Shaft diam.<br>[mm]               | h6   | h7   | h8   | h9   | h11 |
|-----------------------------------|------|------|------|------|-----|
|                                   | rpm  |      |      |      |     |
| Limiting speeds - Shaft tolerance |      |      |      |      |     |
| 12                                | 9500 | 6000 | 4300 | 1500 | 950 |
| 15                                | 9500 | 6000 | 4300 | 1500 | 950 |
| 16                                | 9500 | 6000 | 4300 | 1500 | 950 |
| 17                                | 9500 | 6000 | 4300 | 1500 | 950 |
| 20                                | 8500 | 5300 | 3800 | 1300 | 850 |
| 25                                | 7000 | 4500 | 3200 | 1000 | 700 |
| 30                                | 6300 | 4000 | 2800 | 900  | 630 |
| 35                                | 5300 | 3400 | 2200 | 750  | 530 |
| 40                                | 4800 | 3000 | 1900 | 670  | 480 |

Relubrication is depending on the operating conditions. Dust, load, humidity, temperature, vibrations: all affect the relubrication interval. Below table show indicative values for relubrication intervals.

Please note that all our bearing are pre-greased in the factory. There is no need for immediate re-greasing. Furthermore, regreasing should be done in small amounts and with care.

| Use conditions | Temperature | Re-lubrication period |
|----------------|-------------|-----------------------|
| Clean          | up to 50°C  | 1-2 years             |
| Clean          | 50 ÷ 70 °C  | 4 -8 months           |
| Clean          | 70 ÷ 100 °C | 1 - 3 months          |
| Dirty          | up to 70°C  | 2 - 8 week            |
| Dirty          | 70 ÷ 100 °C | 2 - 4 week            |
| Humid + wet    | -           | 1 - 2 week            |

## Speedset

A few things should be taken into consideration when mounting and using Speedset to get full benefit of its features:

- easy and accurate setting of different positions of the side guides;
- avoid product damage;
- increase the line efficiency.

### Content:

- 1) The system
- 2) Positioning the Speedset units
- 3) The spacer
- 4) Transfers
- 5) Guide rail radius
- 6) Further considerations

### THE SYSTEM:

## Single side adjusting

## Double side adjusting

The Speedset system is available in three maximum travel distances:

There are three different spacer types: QSC, QSB and QPC

## QSC-COLOR CLIP

Can be connected to the bracket or the machine with the VG-QT rope.

| Code     | Ref.       | L     |      |        |
|----------|------------|-------|------|--------|
| 13S00292 | VG-QSC-10M | 10 mm | n°10 | Red    |
| 13S00293 | VG-QSC-12M | 12 mm |      | Blue   |
| 13S00294 | VG-QSC-16M | 16 mm |      | Black  |
| 13S00295 | VG-QSC-20M | 20 mm |      | Green  |
| 13S00296 | VG-QSC-25M | 25 mm |      | Purple |
| 13S00297 | VG-QSC-30M | 30 mm |      | Orange |
| 13S00298 | VG-QSC-40M | 40 mm |      | Gray   |

## QSB - CLIP ON SPACER

Cut to length as needed. Can be connected to the bracket or the machine with the VG-QT rope. Also available in bars of 450 mm.

| Code     | Ref.          | L      |      |
|----------|---------------|--------|------|
| 13S00288 | VG-QSB - 25M  | 25 mm  | n°10 |
| 13S00289 | VG-QSB - 40M  | 40 mm  | n°10 |
| 13S00291 | VG-QSB - 65M  | 65 mm  | n°10 |
| 13S00290 | VG-QSB - 450M | 450 mm | n°1  |

|          |          |        |      |
|----------|----------|--------|------|
| 13S00299 | VG-QT-01 | 225 mm | n°10 |
|----------|----------|--------|------|

## QPC - COLLAR POSITIONING SPACER

Cut to length as needed. Hangs free on the pin when not in use. Available in 450mm lengths.

| Code     | Ref.          | L      |      |
|----------|---------------|--------|------|
| 13S00288 | VG-QSB - 25M  | 25 mm  | n°10 |
| 13S00289 | VG-QSB - 40M  | 40 mm  | n°10 |
| 13S00291 | VG-QSB - 65M  | 65 mm  | n°10 |
| 13S00290 | VG-QSB - 450M | 450 mm | n°1  |

### Speedset in the curve:

Speedset can also be used in curves. It should be taken into consideration that the guide rail in the curve is a separate piece from the guide rail on the straight end. Also an extra hinge must be used and brackets with a swivel head to be able to mount the Speedset units parallel also in the curve. The Speedset units must be parallel to be able to adjust them.  
See sketch underneath.

## The position of the speedset units:

Important is the distance between the brackets of minimum 800-1000 mm, depending on the flexibility of the guide rail and the brackets. The system of Speedset is designed in a way that you can walk alongside the conveyor and change the position of the guide rail bracket after bracket. That means you need enough flexibility to reset the Speedset units one after the other. Speedset has limited flexibility in itself because it also needs to hold the side guide.

Also the stiffness of the bracket influences the flexibility of the whole system. That's why we recommend using the standard 213 (e.g. 13S00009) or 223 (e.g. 13S00042) stainless steel brackets.

Always use a nut instead of a knob to fasten the Speedset unit in the bracket because the absolute position –once set- should not be changed anymore. In this way undeliberate false settings are avoided.

When the guide rail goes across a sideward transfer, the rail itself can be of 1 piece because the Speedset units remain parallel. But the Speedset units should always be positioned before or after the transfer where the guide rail is straight and not bent.

When positioning the Speedset units it should also be taken into consideration that you need some room around the Speedset unit for your hands to make the setting of the different positions.

Important for sufficiently free moving of the Speedset units is the alignment of the clamps on the guide rail with the brackets on the side of the structure.

In short: the Speedset units should be parallel with sufficient distance and well aligned with the clamps holding the guide rail. The Speedset units must have enough room to move. The guide rail itself needs to be stable, straight and/or bent properly. Instead of fixing everything as much as possible you need to give room for movement.

### The spacers:

A key element of the Speedset system are the spacers. They set the relative position of the guide rail.

The spacers for Speedset are supplied uncut at the standard length corresponding to the maximum travel distance of the Speedset unit (25, 40 or 65mm). The QSC style spacer is available in different lengths and different corresponding colours. Of the QSB and QPC style spacer, there's also a 450 mm version available to cut intermediate lengths more efficiently.

The QSC style spacers have the advantage that they have fixed colours which can be used for easy reference of the different positions.

The black QPC style spacer has the advantage that it hangs around the Speedset unit. Three positions can be made with the QPC style spacer per side. More positions can be set with the QSB and QSC. These spacers can be hung at the bracket with the PVC QT rope in order not to lose them.

The total Speedset unit is fixed with an eyebolt and nut. The absolute position is set with this eyebolt/nut. With the spacers the relative position is determined. The length of the spacers or the length of the corner to be cut out of the QPC spacer depends upon the difference in diameter between the products on the line.

## Example using the QPC spacer, single side adjusting:

Note that the corner to be cut out is on the side where the spacer is wider. See picture below.

Bottle diameters: 54, 62 and 89 mm.

The maximum difference is 35 mm (89-54). This requires the Speedset unit with a max. travel distance of 40 mm.

The first position (marked 1 in the above picture) using the QPC spacer is in fact using it without the spacer.

The second is half way (marked as 2 in the above picture) and the third is at the outer end (marked 3 in the above picture).

The first position without the spacer is for the largest bottle. Setting the Speedset units always goes from the outside to the inside.

The relative difference between the first and second position is  $89-62 = 27$  mm. The relative difference between

the first and third position is  $89-54=35$  mm. This means that the total thickness of the spacer is 35 mm.

The standard spacer which comes with the Speedset unit of 40 mm travel distance is also 40 mm and needs to be cut to 35mm.

Then the corner needs to be cut out for the second position. The part of the spacer that stays needs to be 27 mm.

That means that the corner which should be cut out is  $35-27 = 8$  mm (don't forget to calculate with the blade thickness of the cutter).

On request also special QPC spacers are available when the difference between the first and second position (between the largest and second largest bottle) is less than 5 mm.

Contact Technical Support for advise on that situation.

Being able to accurately set the position of the guide rail on the straight end as well as in the curve brings us automatically to the next two questions:

What about the transfers at the entry and exit of the curve?

And what about adjusting the radius of the guide rail in the curve?

## Transfers:

### Guide rail transfers in/out curve:

If we take a conveyor section with a 90° curve. The curve section will be moved back and forth under a 45° angle. See below:

This means that the outside curve section moves away from the straight section when shifted to the outside (larger product diameter). Gap G needs to be covered to ensure a smooth product guiding.

To cover gap "G" there are standard kits available like code 131170:

We always recommend to make the transfer from the straight section to the curve section and back about 100-200 mm before and after the curve (100-200mm straight at the in- and outfeed of the curve)

If the guide rail has sufficient height, cutting it under -for instance- a 30° angle will give in most cases enough horizontal room to cover the gap in the outer (widest) position of the guide rail. In this way the product will always be guided. This is an alternative to the method on page 89.

For more extreme differences in product diameter we advise to contact technical support.

## Radius of guide rail:

In theory when adjusting the guide rail in a curve you would want to also adjust the radius of the guide rail.

Instead of the guide rail radius A you would theoretically want radius B.

In practise however this is hardly ever an issue because the guide rail itself needs to be stable and is -partly- made of stainless steel. Therefore you cannot change the radius.

Also the differences in product diameter tend to be relatively small, so the difference in radius is also small.

If (like just in front and after the machines) the product needs to be guided on the centre of the chain the difference is divided between left and right and thus even less.

In practice these differences are ignored. Important thing is to set the transfers right.

If for whatever reason it is necessary to adjust the radius a few options are possible.

1. Guide rail with the stainless steel backing (like the 19019) only where the clamps are. The rest is plastic only and thus flexible. This is only possible with light weight products.
2. In the case of roller guides, the flexible Speedrail (16S00300) can be used.
3. Any other flexible and still sufficiently stable custom built guide rail.

Depending on the radius of the curve 2 or 3 brackets are supporting the guide rail. For adjusting also the radius you need at least 3 brackets. The 2 outer set the distance. The one in the middle determines the radius.

### Further considerations:

The most important thing is to realize that there is a different thought behind Speedset then with the usual fixed side guide. The usual fixed side guide is kept in place by the stiff and rigid brackets and nuts/knobs. The accuracy is less important because the guide rail can always be forced into position by the rigid brackets.

With Speedset the guide rail is not fixed. It can be moved and is there to be moved. That means the guide rail itself has to be stable, straight and/or well bended in itself. The guide rail cannot be forced into position anymore by the brackets.

This is a major difference in thinking which should not be underestimated.

The guide rail needs to be positioned with a higher accuracy then generally speaking is done with fixed guide rails, because you want small tolerances on the different relative positions. That means you also need smaller tolerances on the absolute positioning.

With the usual fixed side guide it's less important how accurate the brackets are positioned relative to the clamps on the guide rail. Especially when using a bracket with swivel head it can always be made to fit. With Speedset however the clamps and brackets need to be aligned properly to ensure smooth movement of the Speedset units when changing the position of the guide rail. See also under "position of the Speedset units".

Obviously when adjusting the guide rail on 1 side, it's also very important that the opposite fixed side is stable, straight and/or well bent and accurately positioned.

We do not recommend the use of 65 mm travel distance in combination with the 75 mm sleeve.

Using that combination leaves very little room for the QPC spacer hanging around the Speedset unit in the first –outer- position.

Please contact technical support if you need the 65 mm travel distance but you have no room for the 125 mm sleeve.

### Cleaning:

When a line equipped with Speedset gets cleaned, attention should be paid to proper rinsing. Especially foam cleaners have the tendency to get in between the outer –static- sleeve and the inner –adjustable- rod. When the system is rinsed properly the Speedset unit remains easy to move back and forth.

Once in a while some oil may be applied between the inner and the outer part of the Speedset unit to keep it moving easily.

Speedset can also be used for vertical setting of a top guide. In this case attention should be paid to the weight of the guide relative to the strength of the spring. In certain special cases the Speedset unit may be adapted to a more heavy top guide. The spacer and the spring will then change position.

## Roller side guides

### For guiding packed products

Commonly where carton or shrinkfoil packed products are conveyed, a roller side guide is recommended to reduce the risk of damaged packaging material.

When an LBP chain or belt is used also the side guide needs to be a roller guide to make sure the friction on the side of the pack is not higher than underneath the pack.

There are different roller guide systems for both side and centre guide:

- full plastic
- aluminium
- stainless steel

For full details we refer to the components catalogue.

There are two special executions:

**Speedrail** aluminium rail with bead rollers.

The pearl shape of these rollers is particularly suitable for shrink foil packs:

There's also a completely flexible execution that allows a flexible radius or a twisted roller guide.

### Muscle rail:

Muscle rail is a compact stainless steel execution particularly suitable in hygienic circumstances and where rigidity is requested.

### Important points:

- Make sure the roller guide is mounted in line with the pack (mostly vertical) so all rollers are in contact with the pack and the pressure is spread.
- Make sure the rollers touch the pack where the pack has enough stability. This is especially important with shrink wrapped packs of soft drink cans.
- Make sure both side guides are positioned accurately relative to the pack. Then the pack does not get the chance to rotate and increase the pressure on the side guide.
- Make sure the construction holding the intermediate guide is stable enough to keep the roller guide vertical.
- Make sure the individual lengths are mounted in line with each other to avoid little 'steps'.
- Make sure curves are made in a constant radius to get an even pressure on the side guide thru the curve.
- Make sure the distance between bridge elements supporting the roller side guides is short enough to avoid inadmissible bending.

## Steel chain materials

### C45

#### Carbon Steel

This carbon steel material allows a higher yield load capability than stainless steel but is not corrosion resistant, so only suitable for dry environments.

The through hardened plate material provides for a uniform hardness.

**Features:** • Surface hardness: 44 HRC  
**Benefits:** • High mechanical strength  
 • High abrasion resistance

### STANDARD

#### Standard Stainless steel

AISI 430 Stainless steel material with good mechanical characteristics and corrosion resistance. An economical option for many conveying applications. Lower load and lower wear resistance capability than our higher grade stainless steel materials.

**Features:** • Standard stainless steel  
**Benefits:** • Economic solution

### EXTRA PLUS

#### Extra Plus Stainless Steel

High performance stainless steel, specially developed for high speed and heavy duty application. Offers excellent corrosion resistance and highest surface hardness.

**Features:** • Surface hardness of HRC 26-30  
 • Extremely flat and best surface finish  
 • High corrosion and wear resistance  
 • Highest ultimate yield loading capability  
**Benefits:** • Typically used in glide liners and pressureless combiners and very long conveyors.  
 • For improved product stability

### AUSTIC

#### Austenitic Stainless steel

AISI 304 Austenitic stainless steel which offers high corrosion and acid resistance properties.

**Features:** • Stainless steel with 18% chrome and 8% nickel  
**Benefits:** • High corrosion and acid resistance material

## Pin materials for steel & plastic chains

### SPM

#### Standard PIN Material

Special Austenitic stainless steel with higher tensile strength and improved surface hardness. These pins are offered as standard in most stainless steel and plastic chains.

**Features:** • High wear, corrosion and acid resistance  
**Benefits:** • Longer wear life

### HB

#### Special PIN Material

Vacuum hardened stainless steel with exceptionally high wear resistance characteristics, good corrosion and chemical resistance, for high speed and or abrasive applications.

**Benefits:** • Ultimate abrasion resistance  
 • Outstanding wear life

### PPM

#### Plastic PIN Material

Special reinforced acetal resin.

**Benefits:** • Suitable for metal detectors  
 • Easy disposal of chains after use

## Plastic chain materials

**D**

**W**

### Acetal Resin

It is an acetal based material which is used as an economical alternative to our LF acetal material. Acetal is an ideal material for conveyor chains as it offers high tensile + fatigue strengths, good co-efficient of friction and excellent wear resistance properties.

**Colour:** Grey (D) or White (W)

*This material is FDA (Food and Drug Administration) approved for direct contact with food.*

**LF**

**LFG**

**LFW**

### Low Friction Acetal Resin

This material is commonly used in the market and offers an improved co-efficient of friction. It is also suitable for use in high speed applications.

**Colour:** Light Brown (LF), Dark Grey (LFG) or White (LFW)

*This material is FDA (Food and Drug Administration) approved for direct contact with food.*

**XPG**

### Extra Performance

Extra performance Acetal with additives for an even lower co-efficient of friction than LF materials. Suitable for high speed applications and reduced lubrication.

**Colour:** Dark Brown (XPG)

*This material is FDA (Food and Drug Administration) approved for direct contact with food.*

**NG**

**NGG**

**NGD**

### New Generation

Extra performance PBT with lowest coefficient of friction in our range, resulting in good strength and optimum wear resistance, reduced plate wear and reduced pitch elongation. Suitable for high speed and dry running applications. Available exclusively from System Plast.

**Colour:** Green (NG) - Light Grey (NGG) - Dark Grey (NGD)

*This material complies with Directive 2002/72/CE of August 6, 2002 related to materials destined to direct contact with food. Besides it respects the 'Code of Federal Regulation' as published by the Food and Drug Administration (FDA)*

## Special plastic chain materials

*On request and for adequate quantities chains may be produced in other materials such as:*

**AS**

### Anti-static acetal resin

Anti-static material with improved surface conductivity for greater protection against static electrical discharges. **Colour:** Black (AS)

**HT**

### High temperature resistance

High temperature material for applications up to 140°C.

**CR**

### Chemical resistance

Reinforced polypropylene material for greater acid and chemical resistance. Polypropylene has lower mechanical strength than acetal.

**Colour:** White (CR, for chains)

**AR**

### Abrasion resistance

Special wear resistant polyamide resin with improved abrasion resistance characteristics for conveying abrasive products like glass, cast iron.

**Colour:** Black (AR)

**DK**

### Acetal resin with Delrin® Kevlar®

This material offers reduced friction and improved wear resistance compared to standard acetal. **Colour:** Dark grey (DK)

*Delrin® and Kevlar® are registered trade marks of DuPont™*

## Plastic belt materials

### LFG

#### Low Friction Acetal Resin

This material is commonly used in the market and offers an improved co-efficient of friction. It is also suitable for use in high speed applications.

**Colour:** Dark grey (LFG)

*This material is FDA (Food and Drug Administration) approved for direct contact with food.*

### NGG

#### New Generation

Extra performance PBT with lowest coefficient of friction in our range, resulting in good strength and optimum wear resistance, reduced plate wear and reduced pitch elongation. Suitable for high speed and dry running applications. Available exclusively from System Plast.

**Colour:** Light Grey (NGG)

*This material complies with Directive 2002/72/CE of August 6, 2002 related to materials destined to direct contact with food. Besides it respects the 'Code of Federal Regulation' as published by the Food and Drug Administration (FDA)*

## Special plastic belt materials

*On request and for adequate quantities belts may be produced in other materials such as:*

### AS

#### Anti-static acetal resin

Anti-static material with improved surface conductivity for greater protection against static electrical discharges. **Colour:** Black (AS)

### XPG

#### Extra Performance

Extra performance additivated Acetal with a lower co-efficient of friction than LF materials. Suitable for high speed applications and reduced lubrication. **Colour:** Dark Brown (XPG)

### PP

#### Chemical resistance

Polypropylene material for greater and chemical and temperature resistance. Polypropylene has lower mechanical strength than acetal. For belts (PP) the pins and clips are also made of Polypropylene. **Colour:** Light Brown (PP)

### DK

#### Acetal resin with Delrin® Kevlar®

This material offers reduced friction and improved wear resistance compared to standard acetal. **Colour:** Dark Grey (DK)

*Delrin® and Kevlar® are registered trade marks of DuPont™*

### HT

#### High temperature resistance

High temperature material for applications up to 140°C.

## Special colours

*On request and for adequate quantities chains and belts may be produced in other colours.*

### Pin materials for belts

#### PBT

#### PBT

Most commonly used pin material in System Plast belts. It is used in all belts made of LFG, XPG, AS and DK acetal material. The combination of these materials offers a low noise operation.

#### POM

#### POM

Polyacetal pins are used in all belts made of NGG material. This pin material gives optimum strength.

#### PP

#### PP

Polypropylene pins are used in all belts made of PP material. The pin material is adapted to the high temperature and high chemical resistance of the belt material.

### Rubber materials

#### TPR

#### TPR

TPR is used for VG chains and belts and for some gripper chains. TPR is a SEBS type rubber, which assures an optimum bonding on the plastic base material.

#### NBR

#### NBR

NBR rubber is used for our gripper chains.  
It offers a soft grip and a good resistance against oils.

#### EPDM

#### EPDM

EPDM rubber is used for our gripper chains.  
It offers good weather and chemical resistance, although contact with oils, gasoline and concentrated acids must be avoided.

#### EPDM-PP

#### EPDM-PP

EPDM-PP rubber is used for our gripper chains.  
It offers improved chemical resistance and can be used at higher temperatures.  
Resistance against steam is good.

## Nolu-Clean

### An antimicrobial material for improved hygiene for a range of plastic chains, belts and conveyor components.

Hygiene has become an important issue in a number of areas in filling and packaging lines. To support the effectiveness of your cleaning efforts, System Plast offers the possibility to use Nolu-Clean with chains and a range of components.

### Growth inhibition test

- ☐ Bacterial growth with Nolu Clean effect
- ☒ Normal bacterial growth after cleaning

### Bacterial growth test

**Bacterial culture without Nolu-Clean**

**Bacterial culture with Nolu-Clean**

#### Features:

- Provides odor control and hygiene maintenance.
- Durable
- Inhibits growth of: Bacteria, Molds, Yeast
- Listed for industrial use in: Europe, Australia, Canada, China, Japan, South Korea, Philippines, USA, Japan

- Plastic chains
- Modular belts
- Flange bearings
- Brackets
- Other products on request.

Ask your System Plast contact for availability.

## Nolu-S

### What is Nolu-S?

- Nolu-S material is a unique compound of UHMWPE and a solid lubricant.
- Drastically reduces the coefficient of friction, whilst maintaining the characteristics of UHMWPE.
- Nolu-S has a better thermal conductivity compared to UHMWPE.

### Nolu-SR:

For applications that require even higher wear resistance than Nolu-S already offers. Nolu-SR is a further improvement of Nolu-S

### Nolu-S products:

Available for:

- Curves and straight tracks
- Side guides
- Extrusion profiles
- Wear strips

### Nolu-S advantages:

#### **Nolu-S reduces chain pull and avoids problems of overload in curves.**

Other advantages of Nolu-S:

- Noise reduction
- Reduction chainpull- Longer chainlife
- Reduction chainpull - Reduced energy consumption
- Reduced stick-slip
- FDA approved base material and additives
- Suitable for running dry at higher speed

## Wear rates comparison chart (NG)

The diagrams show the wear rate in 0/00 over the test duration in h.  
Test performed under dry run conditions.

Tested with 1.5 l PET bottles

Tested with 1 l glass bottles

Test station

### HB pins

Pin wear is a major factor regarding chain elongation.

Due to their extraordinary hardness HB pins offer a much better resistance against mechanical/abrasive wear and thus extended service life of chain.

HB pins are recommended for the following operating conditions and applications:

- Abrasive environment  
e.g. crate and bottle conveyors
- Short conveyors running at high speed  
e.g. filler area, inspector sections, pressure less combiners
- High load applications  
e.g. accumulation area, full crate conveyors, full bottle accumulation tables

*For material characteristics see page 93.*

### RoHs

Since System Plast does not produce, sell or re-sell electric or electronic equipment/components. Basically RoHs regulations 2002/95/CE and subsequent modifications do not apply. Besides, our products contain (much) less of the elements mentioned in these regulations than the limits mentioned in these regulations.

### Storage of plastic chains and belts

- Materials of our plastic chains and belts offer best stability and resistance against environmental effects at appropriate storage:
  - in the original packaging,
  - without environmental radiation / UV light,
  - dry
  - in a non aggressive environment
  - a temperature between 5°C and 35°C
- First IN, first OUT.  
We have applied that procedure in our logistic department.  
We recommend this procedure to any external warehouse.
- Do not stack pallets or other heavy goods on top of chain packs. Chains inside the packs might get damaged.
- Do not stack chain packs higher than the original stacking height – as dispatched from our shipping department.

## Coefficients of friction

Below listed coefficients can be used as a guideline. Dependent on environmental and application requirements (temperatures, lubricant, material combinations, dirt/debris, product and chain/belt surfaces, etc.) the coefficients are subject to variation.

### Coefficient of friction between chain and wearstrip:

| Chain/belt material    | Lubrication | Wearstrip material    |           |        |               |                            |
|------------------------|-------------|-----------------------|-----------|--------|---------------|----------------------------|
|                        |             | Stainless steel Steel | UHMWPE PA | NOLU-S | Return roller | Extra With metal strip for |
| Stainless steel, steel | Dry         |                       | 0.35      | 0.32   | 0.10          | not applicable             |
|                        | Water       | 0.40                  | 0.27      | 0.24   | 0.08          |                            |
|                        | Water&soap  | 0.20                  | 0.18      | 0.15   | 0.05          |                            |
|                        | Oil         | 0.20                  | 0.18      | 0.15   |               |                            |
| LF- Acetal             | Dry         | 0.24                  | 0.20      | 0.18   | 0.10          | 0.19                       |
|                        | Water       | 0.19                  | 0.16      | 0.14   | 0.08          | 0.15                       |
|                        | Water&soap  | 0.15                  | 0.10      | 0.10   | 0.05          | 0.10                       |
|                        | Oil         | 0.10                  | 0.10      | 0.10   |               |                            |
| XPG- Acetal            | Dry         | 0.22                  | 0.18      | 0.16   | 0.10          | 0.17                       |
|                        | Water       | 0.18                  | 0.14      | 0.13   | 0.08          | 0.14                       |
|                        | Water&soap  | 0.15                  | 0.10      | 0.10   | 0.05          | 0.10                       |
|                        | Oil         | 0.10                  | 0.10      | 0.10   |               |                            |
| NG - PBT               | Dry         | 0.20                  | 0.16      | 0.13   | 0.10          | 0.14                       |
|                        | Water       | 0.17                  | 0.11      | 0.09   | 0.08          | 0.10                       |
|                        | Water&soap  | 0.14                  | 0.09      | 0.08   | 0.05          | 0.09                       |
|                        | Oil         | 0.10                  | 0.10      | 0.10   |               |                            |
| PP                     | Dry         | 0.29                  | 0.24      | 0.21   | 0.10          | 0.23                       |
|                        | Water       | 0.23                  | 0.19      | 0.17   | 0.08          | 0.18                       |

Valid for ambient temperature (21°C)

### Coefficient of friction between chain and product:

| Chain/belt material | Lubrication | Product material |               |           |                    |                |                     |

Valid for ambient temperature (21°C)

## Chemical resistance

Data shown in the table was taken from laboratory tests performed on unstrained samples and are merely indicative.

Chemical resistance under normal working conditions can depend on various factors, such as stress and temperature, concentration of the chemical agent and duration of its effects.

Valid for ambient temperature (21°C)

## ABBREVIATION

C = concentration  
SA = saturated

☆ = good resistance  
● = insufficient resistance ( not recommended)

○ = fairly good resistance depending on use conditions  
blank spaces = no tests performed

## Application temperatures

| Material                       | Symbol          | User for                            | Min temp. °C | Max. temp. °C |                 |

| Nolu-S                         | Nolu-S          | Curves, components                  | -40          | 80            | 80              |

If a chain, belt or other component is composed of several materials, all materials will have to be considered individually.

Please note that the properties of a material changes when the temperature changes.

In general the impact resistance becomes less at low temperatures.

The strength and wear resistance are reduced at elevated temperatures.

High temperatures can also influence the resistance against chemicals.

In case of doubt please consult our Technical Support department.

## Parameters affecting wear rate

### Operating conditions:

- Load
- Speed
- Number of starts per hour
  - No soft start/frequency inverter controlled drive
- Product accumulation
- Lubrication
- Water quality
  - Concentration of chlorines
  - Water hardness
  - Contaminations
  - Discontinuous water supply
- Lubricant
  - Suitability/performance
  - Dosing
  - Efficiency of nozzles

### Cleaning:

- Cleaning agent
  - Frequency
  - Intensity
  - Rinsing
  - Concentration
  - Temperature
- Chemical attack

### Environment:

- Temperature
- Humidity
- Wear increasing media/abrasives
- Corrosion
- Cleanliness
  - Soil e.g. from construction work

### Conveyor components:

- Material quality
- Construction
- Dimensional accuracy of
  - Wear strips
  - Sprockets
  - Idlers
  - Return rollers
- Shaft alignment

### Conveyor construction:

- Choice of chain/belt
- Suitability of selected chain/belt for the application
- Catenary design
  - Tensioner
- Sprocket construction
  - Tooth geometry
  - Number of teeth/polygon effect
- Return part construction
  - Smooth infeed
  - Non rotating return rollers
- Mounting of wear strips
  - Flatness
  - Chamfers
  - Raised portions
  - Expansion compensation gaps

### Changed/modified conditions:

- Modification of conveyor or it's parts/components
  - Maintenance
  - Overhaul

### Cleaning instructions

#### Cleaning is necessary to:

- minimize dirt and debris built up
- keep bacteriological situation under control
- elongate service life of chains/belts
- ensure smooth running of chain/belt for optimum product stability
- prevent crashes due to f.e. glass debris
- prevent malfunction due to sticky residues
- keep friction low

#### Frequency:

**As a rule of thumb we say that cleaning the line once every week is sufficient.**

Of course in practice depending on the circumstances this can be more frequent (f.e. during product changes in case of product loss or other pollution) or less frequent in a relatively clean environment.

In the direct surrounding of the filler cleaning will be more frequent anyway. Depending also on the bacteriological situation it may be necessary to clean at least once a day or once every shift.

Also chemicals coming f.e. from a pasteurizer may ask for more frequent cleaning to prevent the chemicals from affecting the chain/belt materials.

In a can line where aluminium cans are filled, there's the aluminium oxide that has to be kept under control. This can occur also far away from filler-pasteurizer, where the line is running dry. When the cans are accelerating on an inliner the remaining drops will fall down with the aluminium oxide on the chain causing a highly abrasive sludge to built up on the inliner. Therefore it may be necessary to clean more frequent also further down the line due to 'local' circumstances.

#### Method:

Important for an optimum service life of the chains and belts is a general inspection on the conveyors already during operation. Listen for strange –rattling or squeaking- noises. Check transfer plates, return rollers, bearings, etc. Make sure the chain/belt is still running free without extra load or obstruction.

Often the service life of a chain/belt is reduced for mechanical reasons that can be sorted easily.

When cleaning we advice to go thru following steps:

1. Check for foreign parts on the conveyor. Check also the return part.
2. Rinse with warm (max 60°) or cold water thoroughly while chain/belt is running.
3. Use mild (PH-5-9) detergent according to suppliers instructions.
4. If necessary clean mechanically (brush) when pollution is hard to remove.
5. Rinse thoroughly with warm (max 60°) or cold water. Make sure all detergent is rinsed off while chain/belt is running.
6. Final mechanical check that chain/belt is running free and without obstruction.

During this process it's important not to forget to clean in between carry and return section and underneath where the return support system is.

Especially with plastic chains/belts the detergent in use needs to be checked for compatibility with the plastic materials of the chain/belt.

### General:

As obvious as it seems, cleaning is important!

Since nowadays pressure on production rates and production costs is getting higher and higher, companies tend to look at cleaning when trying to cut costs.

Less time and resources are available while at the same time the capacity of the lines (and thus pollution and product loss) has to go up.

When companies are setting up a cleaning regime they tend to focus on the individual machines (mainly filler and surrounding) and not so much on the conveyors. Therefore we want to promote 'CONVEYOR AWARENESS' in this respect.

### Dry versus wet:

When a wet lubricant is in use (water & soap) product loss is normally flushed off by the water & soap. Often the soap also has a 'cleaning function' built in.

But wet circumstances also attract dust and dirt and wet circumstances will increase the growth of bacteria.

When a line is standing still during a stop or during the weekend without cleaning, the lubricant will dry in which may cause pollution and changing sliding characteristics of the chains/belt after several times.

Under dry circumstances the conveyors generally remain cleaner. But product loss needs to be cleaned to avoid functional problems of the line.

Therefore functionally speaking wet lubrication is more safe but requires just as well regular cleaning and is a high cost factor.

All together with the present state of conveyor technology it is possible to run a major part of a glass, can or a PET line dry taken into consideration that a regular cleaning regime is in place.

### Inspection procedure

1. Inspect chains for unusual wear patterns or damage.
2. Look for excessive gaps between chain flights.
3. Check conveying surface for flatness, bent or broken flights.
4. Inspect hold-down tabs or beveled sliding surfaces for excessive wear.
5. Review chain catenary sag for proper amount.
6. If take-ups are used, check that take-up tension is not excessive. Do not preload chain.
7. Check all idlers, rollers, turn discs and sprockets for freedom of rotation.
8. Examine sprockets for excessive wear.
9. Look for debris build up in sprocket tooth pockets.
10. Check for excessive guide ring wear.
11. Check all wear strips and fasteners for excessive wear.
12. Check all transfer points, dead plates, turn tables, turn discs and sprockets for proper elevation and alignment.
13. Review function of lubrication system.
14. Inspect general cleanliness of conveyor system.

### Installation procedure

1. Check all sprockets, idlers, turn discs and rollers for proper elevation and alignment with regard to the conveyor tracks.
2. Check all wear strips (carrying and return), dead plates, dividers and transfers mechanism for proper location, elevation, spacing and flatness.
3. Check all fasteners for proper tightness (torque). Fasteners used on wear strips and dead plates must have recessed heads.
4. Check all conveyor splice points for proper elevation, alignment and fastening.
5. Inspect conveyor system for obstructions by pulling a short section of chain (1 metre) through the entire conveyor.
6. Check lubrication system (if present).
7. Install conveyor chain, assuring that the following has been done:
  - A. Check for correct direction of chain travel.
  - B. Assemble chain in 3 meters sections and avoid twisting or damaging the chain.
  - C. Connect chain sections on the conveyor. Make sure that the connecting pins are not protruding.
  - D. Adjust chain catenary (sag) to the proper elevation. Note: readjustment is usually necessary after a certain operating time.
8. Insure that lubricant is evenly dispersed through conveyor system.
9. Start up conveyor by jogging and/or using short running periods before loading the system.  
Be alert to unusual noises or actions. If a problem should occur, refer to the trouble shooting guide.

To help inserting the pin use our chain mounting block.

## Replacement criteria

**Chains** must be replaced when:

- The chain starts to jump on the sprocket due to elongation. This may start to happen at 3% elongation or more.
- The thickness of the plate has been reduced by 50%.
- The surface becomes uneven or scratched causing stability problems.
- The hinge is worn to an extent that the pins protrude

**Belts** must be replaced when:

- The belt starts to jump on the sprocket due to elongation. This may start to happen at 3% elongation or more.
- The thickness of the module has been reduced by 1 mm from the top and from the bottom.
- The surface becomes uneven or scratched causing stability problems.

When replacing chains/belts, it is recommended to replace wear strips and sprockets/idlers as well.

Replacement of (magnetic) **corner tracks**:

Normal situation:  
chain centered on the curve:

Worn curve:  
chain over the inside edge:

**Sprockets and Idlers** must be replaced when:

- teeth are worn flat
- chain/ belt does not release well
- teeth are damaged
- bore of idler is worn out and idler starts to oscillate
- hub or keyway are damaged
- new chain/ belt is installed

**Wear strip** must be replaced when:

- thickness is reduced by 50% and stability problems occur
- dirt or debris is embedded
- fixing bolts protrude

To be able to **identify a curve** following information is important:

- which type of chain and what width, f.e. 880M-K325
- angle  $\alpha$ ; centre radius  $R$ ; straight lengths in/out  $L_{in}/L_{out}$
- total width  $W$  and pitch  $P$  in case of multiple strand
- type of return;
- inserts; mounting hole, etc

See drawing:

Check the thickness  $T$  of the upper part and for multiple strands measure the pitch  $P$  between the individual strands:

For the return section measure the thickness  $H$  and check whether the tracks are staggered:

For special mounting holes or threaded inserts please provide a detailed drawing of the type and position.

## Chain/belt jumps on sprocket

| Possible causes   | Remedy  |
|---|---|
| Chain/belt is elongated e.g. due to wear or overloading | Replace chain/belt and sprocket.<br>Check other components as well.<br>Eliminate cause of overload. |
| Improper catenary sag                                   | Check dimensions and adjust   |
| Sprocket is worn  | Replace sprocket  |
| Wrong sprocket type                                     | Install correct sprocket  |
| Misaligned sprocket                                     | Check and adjust  |
| Improper sprocket position                              | Check and adjust position   |

## Chain/belt does not release well

| Possible causes                      | Remedy                        |
|--------------------------------------|-------------------------------|
| Incorrect sprocket dimension or type | Check and replace sprocket    |
| Sticky residue                       | Clean chain/sprocket or renew |
| Improper catenary sag                | Check dimension and adjust    |

## Slip stick operation

| Possible causes                  | Remedy   |
|----------------------------------|--|
| Slip stick                       | Use lubrication.<br>Reduce chain/belt tension by shortening the conveyor |
| Return roller diameter too small | Install larger rollers   |
| Chain/belt catches the conveyor  | Remove obstructions.<br>Check return part as well                        |
| Improper catenary sag            | Check dimension and adjust   |

## Damaged chain hinges

| Possible causes                         | Remedy  |
|---|---|
| Overloading                             | Eliminate cause of overloading<br>Check sprockets and other components<br>Replace chain/belt<br>Replace components if necessary |
| Blocking and obstructions               | Check the complete conveyor   |
| Exceeding the minimum backflex radius   | Check conveyor construction   |
| Too small radius for side flexing chain | Check minimum radius of chain and adjust accordingly  |

## Elongation

| Possible causes          | Remedy  |
|--------------------------|---|
| Overloading              | Eliminate cause of overloading<br>Check sprockets and other components<br>Replace chain/belt<br>Replace components if necessary |
| Wear from dirt in hinges | Improve cleaning<br>Use HB pins   |

## Rapid curve wear

| Possible causes    | Remedy                    |
|--------------------|---------------------------|
| Overheating        | Use EXTRA curve or Nolu-S |
| Embedded abrasives | Replace curve             |

## Chain drifts sideways on sprockets

| Possible causes              | Remedy                |
|------------------------------|-----------------------|
| Bad shaft/sprocket alignment | Adjust or use collars |
| Conveyors is not level       | Adjust                |

## Cracked hinge eyes

| Possible causes                                   | Remedy  |
|---|---|
| Stress-corrosion caused by incompatible chemicals | Check chemicals compatibility with chain/belt material<br>Use appropriate chemicals |

## Chains for magnetic system releases from curve

| Possible causes   | Remedy                            |
|---|-----------------------------------|
| Worn curve  | Replace curve                     |
| Improper chamfering of the infeed or other obstructions | Check and adjust/rework           |
| No soft start-up  | Install frequency inverter drives |
| Curve not mounted level                                 | Check and adjust                  |

## Corroded steel chain

| Possible causes  | Remedy                          |
|--|---------------------------------|
| Incompatible combination of chain material and chemicals | Use only compatible chemicals   |
| May occur even with stainless steel                      | Consider higher graded material |

## Excessive chain/belt wear

| Possible causes       | Remedy   |
|-----------------------|--|
| Pollution             | Improve cleaning                                       |
| Failing lubrication   | Check lubrication system<br>Contact lubricant supplier |
| Obstructions          | Check all sections                                     |
| Debris in return part | Clean conveyor<br>Install roller with larger diameter  |

## Sprockets don't slide on shaft when belt extends due to temperature increase

| Possible causes        | Remedy  |
|------------------------|---|
| Pollution              | Improve cleaning  |
| Axial fixing incorrect | Re-adjust axial fixing according to temperature situation |
| Wrong bore tolerance   | Replace by sprockets with PLUS tolerance                  |

## Rapid wear on sprockets

| Possible causes     | Remedy                                  |
|---------------------|---|
| Abrasive conditions | Improve cleaning<br>Use steel sprockets |
